## PREFACE

Bergmann Associates was retained by Parsons Brinckerhoff Quade \& Douglas, Inc. (PB) to prepare this Traffic and Accident Report for the Southtowns Connector / Buffalo Outer Harbor (STC/BOH) project. Existing features and conditions of the highway infrastructure in the study area are described in Chapter 2 of this appendix. Travel forecasts and associated traffic operations for the null alternative and each build alternative are presented in Chapter 3 of this appendix. Two build alternatives of improved access to a brownfield area of South Buffalo and three reconfiguration alternatives of Route 5/Fuhrmann Boulevard are analyzed. Descriptions of each are provided in Chapter 3 of this appendix.

# Appendix C: Traffic \& Accident Report 

 PrefaceThis page intentionally blank.

## CHAPTER 1: OVERVIEW

The Federal Highway Administration (FHWA) and the New York State Department of Transportation (NYSDOT) have prepared a Final Design Report/Final Environmental Impact Statement (FDR/FEIS)/Section 4(f) Evaluation to study the environmental effects of the Southtowns Connector/Buffalo Outer Harbor (STC/BOH) Project, involving a series of transportation access improvements within the New York State NY Route 5 corridor along the Lake Erie waterfront in the City of Buffalo, City of Lackawanna, and Town of Hamburg (from the Skyway touchdown in Buffalo to NY Route 179 in the Town of Hamburg). The project is intended to:

- Improve road access to facilitate redevelopment sites in the vicinity of the Lake Erie waterfront;
- Enhance vehicular access to local roads and enhance access for other modes of travel (bicycles, pedestrian, transit) along the Lake Erie waterfront and within the project;
- Maintain adequate service for commuter/commercial traffic between Downtown Buffalo and Southtowns communities (i.e., Lackawanna, Hamburg, and other outlying towns and villages south of the City of Buffalo);
- Support local and regional planning policies and strategies; and
- Minimize adverse impacts on communities and the environment by avoiding an inequitable distribution of impacts and maintaining neighborhood and community cohesion.
This report assesses the following alternatives considered in the FDR/FEIS.

### 1.1 Null Alternative

The Null Alternative involves implementing only currently planned and committed transportation projects within the STC/BOH project area. For purposes of this assessment, the Null Alternative includes only those improvements currently on the Greater Buffalo Niagara Regional Transportation Council (GBNRTC) 2002-2006 Transportation Improvement Program (TIP).

### 1.2 Build Alternatives

Three feasible build alternatives were formulated to improve transportation access within the STC/BOH project area. The alternatives are generally distinguished by the alignment of NY Route 5 and Fuhrmann Boulevard between the southern terminus of the Skyway to Ridge Road.

The plans, profiles and typical sections for all alternatives are located in Appendix A of the FDR/FEIS document but are described here:

- Modified Improvement Alternative (Preferred Alternative) This alternative reconfigures the NY Route 5/Fuhrmann Boulevard complex along the Buffalo Outer Harbor into a system designed to be more compatible with the proposed land uses included in local plans.
- A new diamond interchange constructed just south of the southern terminus of BIN 1001579 (Skyway) to improve local access to a reconstructed Fuhrmann Boulevard and the NFTA Outer Harbor lands.
This new interchange will replace the existing slip ramps currently serving the Outer Harbor. A roundabout will be constructed at the intersection of the interchange cross road and the reconstructed Fuhrmann Boulevard on western side of NY Route 5 (discussed later).
- Replacement of BIN's 1001559, 1001549, 1001539, with more aesthetically sensitive structures and the removal of BIN's 1001569 and 1074270 on NY Route 5 and the removal of BIN 2260780 on Fuhrmann Boulevard.
- The original proposal to lower the elevation of NY Route 5 will not be included in the preferred alternative. Public comments related to the NY Route 5 elevation indicated a desire to retain the embankment section to lessen the effects of snow drifting on NY Route 5, reduce the frequency of vehicular/animal accidents and to reduce project costs. The NY Route 5 embankment that currently exists shall remain from BIN 1001559 ("Beachline") to BIN 1001579 (Tifft Street) as currently exists.
- The original proposal to construct a pedestrian structure over NY Route 5 has not been included in the preferred alternative. The proposed pedestrian structure has been replaced with a more cost effective pedestrian/eco-sensitive underpass. This structure will be aesthetically sensitive and allow for direct access to Tifft Nature Preserve from the Small Boat Harbor and connect the Multi-use paths that exist now or those that will be constructed. This structure, along with BIN 1001579 (Tifft Street) and BIN 1001549 (Ohio Street) shall also provide a means of travel for small and median size animals to limit vehicle-animal collisions.
- Reconstruction of Fuhrmann Boulevard into a two way roadway on the western side of NY Route 5 from the Union Ship Canal to the U.S. Coast Guard Station.
The reconstructed Fuhrmann Boulevard will include the installation of sidewalks and/or multi-use paths along with architectural lighting, a new closed drainage system, landscaping, signage and striping from the Union Ship Canal to the U.S. Coast Guard Station.

The recommended roadway section of Fuhrmann Boulevard shall consist of:
Union Ship Canal to Tifft Street
$2-3.30 \mathrm{~m}$ ( 11 ft .) lanes (one lane in each direction)
Tifft Street to Michigan Street
$4-3.30 \mathrm{~m}$ ( 11 ft .) lanes (two lanes in each direction) with a 2.40 m ( 8 ft .) median. A new roundabout at the new interchange cross road and Fuhrmann Boulevard is also proposed.

## Michigan Street to the U.S. Coast Guard Station

$3-3.30 \mathrm{~m}$ ( 11 ft .) lanes (one lane in each direction with a continuous two-way center left turn lane)

A new northbound slip exit ramp will be constructed from NY Route 5 to Ohio Street. Ohio Street will terminate at a "T" intersection with Fuhrmann Boulevard (on the western side of NY Route 5). The section of Fuhrmann Boulevard presently located to the east of NY Route 5 between Tifft Street and Ohio Street will be removed. A new entrance drive is will be constructed from Tifft Street to access the Tifft Nature Preserve. The Tifft Street Greenway will be reconstructed to compliment roadway reconstruction.

The existing Tifft Street ramp (Ramp "H") to southbound NY Route 5 is removed and replaced by a new slip ramp constructed south of Tifft to link Fuhrmann Boulevard southbound to NY Route 5 southbound. In addition, two ramps will be constructed north of Tifft Street to complete the Tifft Street/NY Route 5 interchange.

The existing bike/pedestrian path is reconstructed/maintained along Fuhrmann Boulevard (on western side of NY Route 5) to compliment roadway reconstruction.

- Boulevard Alternative This alternative reconstructs the NY Route 5/Fuhrmann Boulevard complex to convert it into a single, six-lane boulevard to serve both through traffic and local access from the southern terminus of the Skyway to Ridge Road. This alignment incorporates a wide landscaped median to separate northbound/southbound lanes and lowering of the roadway's elevation to grade. North of the Skyway, the road connects to the remaining portion of Fuhrmann Boulevard and includes improvements to provide access to Times Beach and the US Coast Guard Station. Vehicular access to properties is provided through curb cuts along the new boulevard, while bicycle/pedestrian access is provided along the lakeside of the roadway. All grade separations at east-west roads are eliminated and replaced with signalized intersections. The Boulevard Alternative also reconstructs or widens the Father Baker Bridge over the Union Ship Canal to accommodate six lanes and pedestrian/bicycle access, as well as reconstruction/widening of one bridge crossing over existing rail lines in the corridor.
- Hybrid Alternative This alternative is a combination of alignments used in the Improvement (as depicted in the June 2005 DR/DEIS) and Boulevard Alternatives. From the southern terminus of the Skyway to Ohio Street, the Hybrid Alternative is an alignment similar to the Improvement Alternative (as depicted in the June 2005 DR/DEIS) --- maintaining NY Route 5 and Fuhrmann Boulevard as separate facilities and converting Fuhrmann Boulevard to a continuous, two-way, two-lane roadway on the west side of NY Route 5 between the US Coast Guard Station and Ohio Street. At Ohio Street, NY Route 5 would transition at a signalized intersection to a six-lane boulevard with a wide center landscape median, similar to the characteristics of the Boulevard Alternative, and Fuhrmann Boulevard is removed south of Ohio Street.

### 1.3 Project Components in All Build Alternatives

The three build alternatives identified above involve a series of other road improvements in key locations within the STC/BOH Study Area, including the following.

- NY Route 5 - Ridge Road to South Buffalo Railroad Bridge Passing through the Bethlehem Park section of the City of Lackawanna, this project component adds a new southbound lane to NY Route 5 along the former Bethlehem Steel site frontage to create a total of six travel lanes in this segment. The South Buffalo Railroad Bridge is reconstructed and widened to allow for this improvement. In addition, the existing center turn lane along this segment is converted to a landscaped median (with left turn lanes at key intersections) and streetscape improvements implemented to provide safe bicycle, pedestrian, and transit access (e.g., bicycle trail, sidewalks, transit shelters, bus curb cuts, etc.).
- NY Route 5 - South Buffalo Railroad Bridge to NY Route 179 (Milestrip Road) This project component incorporates streetscape and safety improvements along NY Route 5 as it passes through a community business district in the Woodlawn section of the Town of Hamburg. These improvements are similar to those proposed along NY Route 5 between Ridge Road and the South Buffalo Railroad Bridge with the exception of any road widening, given that this segment currently contains six travel lanes.
- New I-190/Tifft Street Arterial This project component consists of construction of a new four-lane (or two-lane expandable to four-lane) arterial road connecting I-190 to Tifft Street, with signalized intersections at Seneca Street, Elk Street, and South Park Avenue. The alignment of the new road consists of construction of new on/off ramps at the existing Seneca Street interchange on l-190 and it follows a former railroad right-of-way to a new fixed bridge over the Buffalo River beyond the river's navigable portion for commercial vessels. The alignment passes through the eastern portion of the former LTV/Republic Steel site. In addition, a new bicycle/pedestrian trail is constructed along the full length of the alignment.
- Ohio Street Improvements From Michigan Avenue to NY Route 5 through Buffalo's First Ward neighborhood, this project component reconstructs Ohio Street so that it provides better local access between downtown Buffalo and the Lake Erie waterfront. The alignment includes three lanes (two travel lanes and a center turn lane) within the existing curb-to-curb width of the roadway and streetscape improvements to provide safe pedestrian, bicycle, and transit access. In addition, this project component includes construction of a segment of the Industrial Heritage Trail along the west side of Ohio Street and the east side of Ganson Street, including a sidewalk marked with commemorative medallions with locations for interpretive stations.

This page intentionally blank.

## CHAPTER 2: EXISTING FEATURES/CONDITIONS

Existing features and conditions of the principal highway system in the project study area potentially affected by build alternatives are described. Specific locations where non-standard features exist are also identified. The study area for the traffic modeling encompasses the area bounded by Interstate 90 (I-90) to the east, Interstate 190 (I-190) to the north, Lake Erie to the west, and Mile Strip Road (NYS Route 179) to the south.

### 2.1 Functional Classification and National Highway System (NHS)

Functional Classification is a way to categorize a roadway's traffic and travel function within the road and street network. It is the process by which streets and highways are grouped according to the traffic service they are intended to provide. There are three functional classifications: arterial, collector, and local roads.

Arterials provide the highest level of service at the greatest speed for the longest uninterrupted distance, with varying degrees of access control. Arterial expressways are limited access roads that are physically separated from cross streets and railroads, with access provided at interchanges. Route 5 is functionally classified as an urban arterial expressway from I-190 to Ridge Road, where it transitions into an urban principal arterial. Mile Strip Road (Route 179) is also an urban arterial expressway between Route 5 and South Park Avenue (NYS Route 62). Both Route 5 and Mile Strip Road are part of the National Highway System (NHS). The NHS is a national system of primary roads that are of national importance. The NHS was created as part of the Federal Intermodal Surface Transportation Efficiency Act of 1991.

Principal arterial roadways in the project area include Bailey Avenue and Seneca Street. Minor arterial roadways in the project area include Fuhrmann Boulevard, Ohio Street, Louisiana Street, Smith Street, Keating Street, Elk Street between Keating and Seneca Streets, Tifft Street, and Ridge Road. South Park Avenue is functionally classified as a minor arterial from Michigan Avenue to Bailey Avenue, where it transitions into a principal arterial south to Mile Strip Road.

Collector streets provide a less highly developed level of service at lower speeds for shorter distances by collecting traffic from local roads and connecting them with the arterial system. Lake Avenue, Hopkins Street and Elk Street between Babcock and Keating Streets are collector streets within the project area.

All roads within the study area are Federal Aid Eligible. The functional classification of roads and streets in the project area are shown in Figure C2.1-1.

This page intentionally blank.

### 2.2 Ownership and Maintenance Jurisdiction

The NYSDOT has ownership and maintenance jurisdiction of Route 5 and Mile Strip Road. Lake Avenue is owned and maintained by Erie County. The City of Lackawanna owns and maintains Ridge Road. All other streets in the study area are owned and maintained by the City of Buffalo.

### 2.3 Control of Access

Uncontrolled access exists throughout most of the study area. Controlled access exists along Route 5 between I-190 and Ridge Road and along Mile Strip Road between Route 5 and South Park Avenue. All other study area roadways have at grade intersections and driveways.

Not all driveways in the study area conform with the NYSDOT's "Policy and Standards for Entrances to State Highways" as shown in Section 2.14 of this report.

### 2.4 Existing Highway Sections

The following information describes the features of the highway sections within the study area. Table C2.4-1 provides travel lane information, including speed limit, pavement width, and number and type of lanes. Table C2.4-2 provides Right-of-Way (ROW) width information, and Table C2.4-3 provides roadway median and clear zone information, including type of median, width of median, and width of clear zone. Table C2.4-4 provides roadway shoulder information, including type and width. Table C2.4-5 provides the location of curb within the study area.

## Travel Lane Information

Table C2.4-1 - Travel Lane Information

| Route | Segment | Length miles | Speed Limit km/h (mph) | Pavement Width m (ft) | $\begin{gathered} \text { \# of } \\ \text { Lanes } \end{gathered}$ | \# of Through Lanes | \# $\mathbf{~ f}$ Parking Lanes |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Route 5 | Mile Strip to Lake | 0.35 | 64 (40) | 23.2 (76) | 7 | 7 (3 EB, $3 \mathrm{WB}, 1$ left turn lane) | 1 EB any time 1 WB any time |
|  | Lake to Lackawanna City Line | 0.68 | 64 (40) | 23.2 (76) | 7 | 6 (3 EB, $3 \mathrm{WB}, 1$ left turn lane) | 0 EB any time 1 WB any time |

## Curb Locations

Table C2.4-5 - Curb Locations

| Route | Segment | Location |
| :--- | :--- | :--- |
| Route 5 | Ridge Rd. to Mile Strip | Both sides |
| Fuhrmann Blvd - SB | Route 5 on-ramp to Fuhrmann / Route 5 underpass | Both sides |
|  | Tifft St. to loop-around by Union Canal | Both sides |
| Fuhrmann Blvd - NB | Fuhrmann / Route 5 underpass to S. Michigan Ave. | Both sides |
| Fuhrmann Blvd | Fuhrmann / Route 5 underpass to Ohio St. | Both sides |
| South Park Ave | Michigan Ave. to Ridge Rd. | Both sides |
|  | Michigan Ave. to Miami St. | Both sides |
|  | Miami St. to Chicago St. | Both sides |
|  | Chicago St. to RR Tracks | Both sides |
|  | RR Tracks to South St. | Both sides |
|  | South St. to Louisiana St. | Both sides |
|  | Louisiana St. to Ganson St./Childs St. | Both sides |
|  | Ganson St./Childs St. to Fuhrmann Blvd. | Both sides |
| Louisiana St | South Park Ave. to Ohio St. | Both sides |
| Smith St | Elk St. to South Park Ave. | Both sides |
| Keating St | Seneca St. to Elk St. | Both sides |
| Bailey Ave | Clinton St. to South Park Ave. | Both sides |
| Hopkins St | South Park Ave. to Tifft St. | Both sides |
|  | Tifft St. to Ladner Ave. | Both sides |
|  | Ladner Ave. to Larrabee St. | Both sides |
|  | Larrabee St. to RR Tracks | Both sides |
| Seneca St | Babcock St. to Elk St. | Both sides |
| Elk St | Babcock St. to Seneca St. | Both sides |
| Tifft St | Fuhrmann Blvd. to South Park Ave. | Both sides |
| Ridge Rd | Fuhrmann Blvd. to RR Tracks | Both sides |
| Lake Ave | RR Tracks to RR Tracks | Both sides |

## Parking Restrictions

Additional information and detailed parking restrictions are listed in Table C2.4-6.

## Route 5

No parking is permitted along Route 5 between Church Street and Buffalo Specialty Products. Parking between Buffalo Specialty Products and Mile Strip Road is limited to 1-hour parking.

## South Park Avenue

Parking regulations vary greatly along South Park Avenue. Parking is allowed along South Park Avenue except during peak period, peak direction of traffic. In other segments, parking is permitted with 2-hour restrictions.

## Smith Street

Parking is allowed along Smith Street between Elk Street and South Park Avenue except during peak periods.

## Hopkins Street

Parking is allowed along Hopkins Street between South Park Avenue and Tifft Street.

## Seneca Street

No parking is permitted along Seneca Street within the project area except between Babcock and Hayes Place with 1-hour restrictions.

## Tifft Street

No parking is permitted on Tifft Street between Route 5 and Hopkins Street. Parking is restricted to the south side from Hopkins Street to South Park Avenue except during peak hours.

## Ridge Road

No parking is permitted along Ridge Road in the project area except between Gates Avenue and Ingham Avenue with seasonal restrictions.

No parking is permitted along Fuhrmann Boulevard, Ohio Street, Louisiana Street, Keating Street, Bailey Avenue, Elk Street, Lake Avenue, or Mile Strip Road at any time within the project area.

This page intentionally blank.

Table C2.4-6 - Parking Restrictions

| Route | Segment | Parking | Location | Parking Restrictions |
| :---: | :---: | :---: | :---: | :---: |
| Route 5 | Skyway to Buffalo Specialty Products | No | Both sides |  |
|  | Buffalo Specialty Products to $5^{\text {th }} \mathrm{St}$. | Yes | West side | 1 hr . restriction ( $7 \mathrm{am}-7 \mathrm{pm}$ ). |
|  | Buffalo Specialty Products to Hawley Rd. | Yes | East side | 1 hr . restriction ( $7 \mathrm{am}-7 \mathrm{pm}$ ). |
| Fuhrmann Blvd. | I-190 to Ridge Rd | No | Both sides |  |
| South Park Ave. | Michigan Ave. to Moore St. | No | Both sides |  |
|  | Moore St. to Louisiana St. | Yes | South side | No parking (1:30am - 7am) from 11/15 to 4/1. |
|  | Moore St. to Louisiana St. | No | North side | No standing (7am - 10am, 4pm-6pm), except Sat. \& Sun |
|  | Louisiana St. to Sidway St. | Yes | Both sides | 1 hr . restriction (7am - 7pm), except Sun. |
|  | Sidway St. to Harvey Pl. | No | Both sides | No standing. |
|  | Harvey Pl. to Smith St. | Yes | South side | No standing (4pm - 6pm), except Sat. \& Sun. |
|  | Harvey Pl. to Bolton Pl. | Yes | North side | No standing (7am - 9am), except Sat. \& Sun. No parking (1:30am - 7am) from 11/15 to 4/1. |
|  | Bolton Pl. to Smith St. | Yes | North side | 2 hr . restriction ( $9 \mathrm{am}-7 \mathrm{pm}$ ), except Sun. No standing (7am - 9am), except Sat. \& Sun. |
|  | Smith St. to Buffalo River | No | Both sides | No standing. |
|  | Buffalo River to Abby St. | No | South side | No standing. |
|  | Buffalo River to Bertha St. | No | North side | No standing. |
|  | Abby St. to Lilac St. | Yes | South side | No parking (1:30am - 7am) from 11/15 to 4/1. |
|  | Bertha St. to Abby St. | Yes | North side | No parking (1:30am - 7am) from 11/15 to 4/1. |
|  | Lilac St. to Bailey Ave. | Yes | South side | No standing ( $4 \mathrm{pm}-6 \mathrm{pm}$ ), except Sat. \& Sun. |
|  | Abby St. to Bailey Ave. | Yes | North side | No standing (7am - 9am), except Sat. \& Sun. |
|  | Bailey Ave. to Verona St. | No | Both sides |  |
|  | Verona St. to Southside Pkwy. | Yes | Both sides | 2 hr . restriction ( $7 \mathrm{am}-7 \mathrm{pm}$ ), except Sun. |
|  | Southside Pkwy. to Aldrich Pl. | Yes | East side | 2 hr . restriction ( $9 \mathrm{am}-7 \mathrm{pm}$ ), except Sun. No standing (7am - 9am), except Sat. \& Sun. |
|  | Southside Pkwy, to Tifft St. | Yes | West side | 2 hr . restriction ( $7 \mathrm{am}-7 \mathrm{pm}$ ), except Sun. No standing ( $4 \mathrm{pm}-6 \mathrm{pm}$ ), except Sat. \& Sun. |
|  | Tifft St. to Aldrich Pl. | Yes | West side | 2 hr . restriction ( $7 \mathrm{am}-4 \mathrm{pm}$ ), except Sun. No standing ( $4 \mathrm{pm}-6 \mathrm{pm}$ ), except Sat. \& Sun. |
|  | Aldrich Pl. to Ridge Rd. | Yes | East side | 2 hr . restriction ( $8 \mathrm{am}-6 \mathrm{pm}$ ), weekdays. No standing (7am - 9am), except Sat. \& Sun. |
|  | Aldrich Pl. to Nason Pkwy. | No | West side | No standing. |
|  | Nason Pkwy. to Ridge Rd. | Yes | West side | 2 hr . restriction ( $8 \mathrm{am}-6 \mathrm{pm}$ ), weekdays. No standing (4pm - 6pm), except Sat. \& Sun. |
| Ohio St. | Michigan Ave. to Fuhrmann Blvd. | No | Both sides |  |
| Louisiana St. | South Park Ave. to Ohio St. | No | Both sides | There are occasional "No standing" signs, but no parking restrictions or prohibitions. |
| Smith St. | Elk St. to South Park Ave. | Yes | West side | No standing (7am - 9am, 4pm - 7pm), except Sat. \& Sun. |

## Geometry Data

I-190
The vertical and horizontal geometry data was collected from the 1999 record plans NYSTA TAN 89-39B. The stationing listed in the tables came from these record plans. Tables C2.4-7a and $\mathbf{C 2 . 4 - 7 b}$ have been organized from easternmost to westernmost corridor segments.

## Route 5

Due to the age of NYS Route 5 and the number of repaving, and reconstruction projects along the corridor from Church Street to Mile Strip Road, the centerline stationing information contained in the following tables is inconsistent. There are many locations where vertical and/or horizontal information is not available ( $\mathrm{n} / \mathrm{a}$ ) or broken between segments along specific projects. Overlapping centerlines, unusual stationing prefixes, southbound versus northbound station incrementation, and station units were also varied from one plan set to the next. The year of the record plans used for each table is listed in the notes for each. Approximations from intersections have been used to enable the reader to more easily locate the appropriate geometric features described in the tables. Also, each individual table references the NYSDOT Contract number for cross-referencing. Tables C2.4-8 through C2.4-12b have been organized from southernmost to northernmost corridor segments.

## Intersections

Geometrics of select intersections, located primarily on Route 5, South Park Avenue, Bailey Avenue, Tifft Street and Ridge Road, are shown in Figures C2.4-1 through C2.4-20.

### 2.5 Abutting Highway Segments and Future Plans for Abutting Highway Segments

There are no proposed or anticipated projects for highway segments adjacent to the study area. Figures C2.4-1 through C2.4-20 contain existing intersection information, including some abutting roadway data. In addition, the New York State Department of Transportation (NYSDOT) has provided pavement scores based on 2001 field inspections for roadways within the study area. The rating system for pavement surfaces ranges from 1 (poor, impassable at posted speed) to 6 (fair) to 10 (excellent, no distress, recently constructed or reconstructed). Mile Strip Road between Route 5 and South Park Avenue was rated 10. Lake Avenue between Route 5 and the Conrail Tracks was rated 8, which is described as good condition with distress symptoms beginning to show. A rating of 7, which is also described as pavements giving a good ride, but showing infrequent to occasional signs of surface deterioration, was given to Keating Street. A rating of 6 was given to South Park Avenue between Bailey Avenue and Ridge Road, Bailey Avenue and Tifft Street. Ratings of 4 and 5, which are described as poor condition because distress is frequent, was given to South Park Avenue between Michigan Avenue and Bailey Avenue, Ohio Street, Louisiana Street, Smith Street, Hopkins Street, Seneca Street, Elk Street, and Ridge Road.

### 2.6 Speeds and Delay

### 2.6.1 Posted Speeds

The posted speeds for each roadway are listed in Table C2.6-1.

Table C2.6-1 - Existing Posted Speed Limits

| Route | Segment | Posted <br> Speed Limit <br> $\mathbf{k m / h}(\mathbf{m p h})$ |
| :--- | :--- | :---: |
| Route 5 | Mile Strip to Ridge Rd | $64(40)$ |
|  | Ridge Rd to Church St | $88(55)$ |

| Ridge Rd | Rte 5 to South Park Ave | $48(30)$ |
| Lake Ave | Rte 5 to Conrail Tracks | $48(30)$ |
| Mile Strip | Rte 5 to South Park Ave | $48(30)$ |

### 2.6.2 Existing Speed and Delay Study

Travel time and delay studies were conducted for both Route 5 and South Park Avenue within the study area. These studies were performed weekdays during three different times of day: morning or AM (7-9), mid-day (11AM-1PM), and afternoon or PM (4-6) peak periods. Travel time and delay studies provide data on the amount of time it takes to traverse the Route 5 and South Park Avenue corridors, the free flow speed, overall average operating speed, magnitude of delay and cause of delay.

## Route 5

The Route 5 segment began at the intersection of Church Street and the Skyway and ended west of the Mile Strip overpass. Both Route 5 eastbound and westbound studies were conducted. The posted speed limit (regulatory) along Route 5 between Church Street and Ridge Road is $88 \mathrm{~km} / \mathrm{h}$ ( 55 mph ). Between Ridge Road and Mile Strip the speed limit is $64 \mathrm{~km} / \mathrm{h}(40 \mathrm{mph})$. The results of this study have been compiled into Table C2.6-2

In general, operating speeds on the $88 \mathrm{~km} / \mathrm{h}(55 \mathrm{mph})$ section of Route 5 between Church Street and Ridge Road are slower in the eastbound (inbound) direction than the westbound (outbound) direction, regardless of time of day. Traffic is also operating at speeds below the posted speed limit in this section of Route 5. The average operating speed in the eastbound (inbound) direction is $69 \mathrm{~km} / \mathrm{h}(43 \mathrm{mph})$ for the AM peak period, $79 \mathrm{~km} / \mathrm{h}(49 \mathrm{mph})$ for the mid-day offpeak period, and $78 \mathrm{~km} / \mathrm{h}(48 \mathrm{mph})$ for the PM peak period. The average operating speed in the

Figure C2.4-18 - Intersection Layout: Route 5 and Dona Street

Figure C2.4-19 - Intersection Layout: Route 5 and Madison Avenue

Figure C2.4-20 - Intersection Layout: Route 5 and Lake Avenue
westbound (outbound) direction is $83 \mathrm{~km} / \mathrm{h}(52 \mathrm{mph})$ for the AM peak period, $84 \mathrm{~km} / \mathrm{h}(42 \mathrm{mph})$ for the mid-day off-peak period, and $81 \mathrm{~km} / \mathrm{h}(50 \mathrm{mph})$ for the PM peak period. The greatest delays were experienced between Church Street and the apex of the Skyway in the eastbound (inbound) direction.

In general, operating speeds are slower during peak hour in the peak direction of flow of the 64 $\mathrm{km} / \mathrm{h}(40 \mathrm{mph})$ section of Route 5 between Ridge Road and Mile Strip. The average operating speed in the eastbound (inbound) direction is $58 \mathrm{~km} / \mathrm{h}(36 \mathrm{mph})$ for the AM peak period, $64 \mathrm{~km} / \mathrm{h}$ ( 40 mph ) for the mid-day off-peak period, and $65 \mathrm{~km} / \mathrm{h}(40 \mathrm{mph})$ for the PM peak period. The average operating speed in the westbound (outbound) direction is $67 \mathrm{~km} / \mathrm{h}(42 \mathrm{mph}$ ) for the AM peak period, $66 \mathrm{~km} / \mathrm{h}(41 \mathrm{mph})$ for the mid-day off-peak period, and $56 \mathrm{~km} / \mathrm{h}(35 \mathrm{mph})$ for the PM peak period. No significant delays were experienced in this section of Route 5.

## South Park Avenue

The South Park Avenue segment began just north of Michigan Avenue and ended just south of Tifft Street. Five northbound runs and five southbound runs were conducted. The posted speed limit (regulatory) along South Park Avenue is $48 \mathrm{~km} / \mathrm{h}(30 \mathrm{mph})$. The results of this study have been compiled into Table C2.6-2.

In general, operating speeds along South Park Avenue are slightly higher in the PM peak period regardless of peak-direction. Traffic is also operating at speeds below the posted speed limit for all study time periods. The average operating speed in the southbound direction is $36 \mathrm{~km} / \mathrm{h}$ ( 22 mph ) for the AM peak period, $36 \mathrm{~km} / \mathrm{h}(22 \mathrm{mph})$ for the mid-day off-peak period, and $37 \mathrm{~km} / \mathrm{h}$ ( 23 mph ) for the PM peak period. The average operating speed in the northbound direction is 36 $\mathrm{km} / \mathrm{h}(22 \mathrm{mph})$ for the AM peak period, $38 \mathrm{~km} / \mathrm{h}(24 \mathrm{mph})$ for the mid-day off-peak period, and $40 \mathrm{~km} / \mathrm{h}(25 \mathrm{mph})$ for the PM peak period. Delays in the southbound direction vary greatly between peak hour and peak direction. The greatest delay in the northbound direction is experienced between Southside and Bailey Avenue, regardless of time of travel. The greatest delay in the southbound direction occurs during the mid-day peak period between Hopkins Street and Southside.

Detailed data for the travel time and delay study is provided in Attachment A.

## Appendix C: Traffic \& Accident Report Chapter 2: Existing Features/Conditions

### 2.7 Traffic Volumes

To understand the characteristics and patterns of vehicular traffic within the study area, current traffic volume data was gathered for select roadway segments and intersections. This data will be used to assess the study area traffic demand. The following traffic data was collected:

- Annual Average Daily Traffic (AADT)
- Peak Hour Directional Traffic Volumes
- Peak Hour Turning Movements
- Vehicle Classifications

### 2.7.1 Annual Average Daily Traffic

The Annual Average Daily Traffic (AADT) is an estimate of the total number of vehicles traveling over a section of highway during one year divided by the number of days in the year. AADT is the most basic measure of traffic demand. Table C2.7-1 contains existing (year 2001) two-way AADT data.

### 2.7.2 Peak Hour Directional Traffic Volumes

The roadway segment Peak Hour Directional Traffic data was collected for the weekday morning and afternoon peak hours in the study area. Table C2.7-1 contains existing Peak Hour Directional Traffic data.

### 2.7.3 Peak Hour Turning Movements

Morning (AM), mid-day, and evening (PM) turning movement counts were conducted at selected signalized and unsignalized intersections throughout the study area. The intersection traffic counts were conducted from 7:00 to 9:00 AM, 11:30 AM to 1:30 PM, and 4:00 to 6:00 PM. Four intersections along Route 5 were counted in February 2002. These were Odell Street, Dona Street, Madison Avenue, and Lake Avenue. October 2001 turning counts were performed at Bailey Avenue/South Park Avenue, Ridge Road/Fuhrmann Boulevard, South Park Avenue at Michigan Avenue, Smith Street and Tifft Street, and Ohio Street at Michigan Avenue and Fuhrmann Boulevard. The remaining counts were performed by GBNRTC in May and June of 1999. The weekday morning peak hour of the study area was determined to be 7:00 to 8:00 AM and the weekday evening peak hour was determined to be 5:00 to 6:00 PM. Existing Peak Hour Turning Movement Volumes are shown in Figures C2.4-1 through C2.4-20.

### 2.7.4 Vehicle Classifications

Vehicle classification data identifies the mix or type of vehicles traveling along highways and streets. Vehicle classification counts, including heavy vehicles, were conducted within the study area as part of the turning movement count collection. Vehicle classification counts were collected manually at each site for two-hour periods during the peak AM, mid-day, and PM hours. Counts were conducted by direction of travel. The vehicle classifications are summarized in Table C2.7-2.

### 2.8 Level of Service

Level of Service (LOS) analysis is a means of determining the ability of an intersection or roadway to accommodate traffic volumes and of comparing different operational conditions. The analysis is based on traffic volumes, characteristics of the traffic stream, and geometry. LOS is a qualitative measure that describes motorist satisfaction with various factors influencing the degree of traffic congestion. These factors include travel time, speed, maneuverability, safety, and delay.

The Level of Service analysis methodology is documented in the Highway Capacity Manual (HCM) published by the Transportation Research Board, 2000. The 2000 HCM and the Highway Capacity Software (HCS) developed for the Federal Highway Administration were utilized for this analysis.

Levels of Service range from A to F, with A representing the best traffic operating conditions that have little or no delay and F characterizing the worst conditions that have significant delay. LOS A through D are usually considered acceptable and LOS E is normally considered representative of conditions where improvements are needed. LOS F operating conditions are highly congested with forced (break down) flow and substantial delays. Lane capacities are often, though not always, exceeded at LOS F. LOS F conditions are typically unacceptable and improvements are needed, in the form of traffic control, geometric changes or a combination of both. Attachment B includes full definitions of levels of service for expressways, signalized and unsignalized intersections.

### 2.8.1 Intersection Level of Service

Levels of Service for signalized and unsignalized intersections are identified by the average control delay experienced by vehicles in seconds/vehicle. Control delay includes the initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. LOS for signalized intersections is determined for each traffic movement, as well as the total intersection. LOS for unsignalized intersection is determined for the minor approach (stop sign controlled) traffic movements and major approach left turns. The range of seconds of delay defining LOS is different for signalized and unsignalized intersections. Therefore, the LOS results should not be compared to one another.

Existing (2001) weekday AM, Mid-Day, and PM peak hour LOS were calculated for selected intersections within the project area. Traffic signal timings and lane geometry were obtained from field site reconnaissance. A summary of these intersection LOS results is contained in Table C2.8-1

As shown in this table, (Table C2.8-1), all lane groups at signalized intersections are presently operating with overall acceptable levels of service (LOS D or better) during each peak hour with the exception of Route 5 at Dona Street which operated at an overall LOS E during the PM peak hour. Of the six unsignalized intersections analyzed, controlled approaches of three currently operate at LOS E or LOS F during at least one of the peak hours. Overall LOS for each intersection is shown in Figure C2.8-1.

### 2.8.2 Freeway Level of Service

Levels of Service of freeways are identified by vehicle density expressed in terms of passenger cars per mile per lane ( $\mathrm{pc} / \mathrm{mi} / \mathrm{ln}$ ). The flow rate is affected by numerous factors, including free flow speed during non-congested conditions, number of travel lanes, lane widths, shoulder widths, interchange density, grade, and peaking characteristics of traffic volume. LOS for freeways is determined for each direction of traffic. Full definitions of LOS for freeway segments are included in Attachment B.

Existing (2001) weekday morning (AM) and afternoon (PM) peak hour traffic operations for selected freeways within the project area were determined in terms of LOS. Lane geometry was obtained from record plans and/or field visits. A summary of the freeway LOS results for AM and PM peak hours of traffic is contained in Table C2.8-2.

As shown in Table C2.8-2, all freeway segments, that are not Interstates, operate with acceptable levels of service (LOS D or better) during each peak hour. However, facilities on the Interstate system must operate at LOS C or better. The segment of I-90 between Ridge Road (Exit 55) and Route 400 (Exit 54) operates at LOS D during the morning peak hour in the eastbound direction and LOS D during the afternoon peak hour in the westbound direction. In addition, the segment of I-90 between Route 400 (Exit 54) and I-190 (Exit 53) operates at LOS E during the morning peak hour in the eastbound direction and LOS E during the afternoon peak hour in the westbound direction. Subsequent to the 2001 traffic count collection, I-90 between Route 400 (Exit 54) and I-190 (Exit 53) has been reconstructed and expanded to four lanes in each direction.

Some segments of I-190 also experience LOS D operations during the afternoon peak hour. Southbound I-190 between Bailey Avenue and Smith Street, between Smith Street and Hamburg Street, and between Hamburg Street and Elm/Oak Arterial operate at LOS D during the afternoon peak hour.

Table C2.8-2 - Existing Freeway LOS

| Route | Segment | Direction | LOS/Density ${ }^{1}$ |  |
| :---: | :---: | :---: | :---: | :---: |

${ }^{1}$ Density measured in units of passenger cars per mile per lane ( $\mathrm{pc} / \mathrm{mi} / \mathrm{ln}$ )

### 2.9 Non-Standard Features and Non-Conforming Features

Non-standard and non-conforming features were identified for the existing facilities based on design speed and functional classification of the route. The highway geometry of Route 5 within the project corridor can be characterized as two distinctly different sections. From I-190 to Ridge Road, the roadway is classified as "Urban Arterial Expressway" and is characterized by a four lane divided expressway with grade separated intersections. The posted speed in this section is $88 \mathrm{~km} / \mathrm{h}(55 \mathrm{mph})$. Between Ridge Road and Mile Strip Road (Route 179), the roadway is classified as an "Urban Principal Arterial" and is characterized by a four lane
undivided roadway with at grade signalized intersections. The posted speed in this section is 64 $\mathrm{km} / \mathrm{h}(40 \mathrm{mph})$.

The other roads analyzed for non-standard and/or non-conforming features are Ohio Street, South Park Avenue between the Buffalo River and Bailey Avenue, Bailey Avenue between Seneca Street and Elk Street, Elk Street and Seneca Street as they intersect Bailey Avenue. Bailey Avenue and Seneca Street are classified as "Urban Principal Arterials". South Park Avenue, Ohio Street and Elk Street are classified as "Urban Minor Arterials".

### 2.9.1 Non-Standard Features

Non-standard is defined in this text as a condition less than current applicable State or Federal standards for arterials and/or expressways. The following are non-standard features:

## Lateral Clearance

The minimum lateral clearance for the curbed section of Route 5, between Mile Strip Road and Ridge Road is $0.5 \mathrm{~m}\left(1^{\prime}-8\right.$ '). However, the existing lateral clearance at the railroad bridge over Route 5 near Buffalo Specialty Products is $0.3 \mathrm{~m}\left(1^{\prime}-1 "\right)$. This non-standard feature is located on the west side where corrugated beam guide rail is attached to the face of the bridge abutment.

## Stopping Sight Distance

Minimum stopping sight distance for Route 5 from the Skyway to Ridge Road is 160 m ( 525 ft .). However, the vertical curve located at the bridge that carries Route 5 over Service Road "C" (BIN 1001539) is $155 \mathrm{~m}(507 \mathrm{ft}$.).

## Lane Width

Minimum travel lane widths for Route 5 between Mile Strip Road and Ridge Road are 3.6 m ( 12 ft .). However, lane widths along this corridor are generally 3.3 m ( 11 ft .), with the exception of the roadway and bridge improvements made in the Smokes Creek area between milepost markers 5-5302-2003 and 5-5302-2008.

## Shoulder Width

Based on truck traffic exceeding 250 DDHV (directional design hourly volume), the shoulder widths for Route 5 between the Skyway and Ridge Road should be 3.6 m ( 12 ft .) for both left and right sides, However, as evidenced in Table C2.7-2 - Vehicle Classification Summary, the right side shoulder widths are non-standard because they are 3.0 m ( 10 ft .). Left side shoulder widths are also non-standard as they vary from 0.6 m to $1.8 \mathrm{~m}(2 \mathrm{ft}$. to 6 ft$)$.

## Bridge Roadway Width

Four bridges along Route 5 including, BIN 1001569 (Route 5 over Service Road "D"), BIN 1001559 (Route 5 over Conrail RR), BIN 1001549 (Route 5 over Ohio Street) and BIN 1001539 (Route 5 over Service Road "C"), do not carry the full width of the approach roadway. Therefore, they are non-standard bridge widths as specified in Section 2.3.3 of the "NYSDOT Bridge Manual" dated April 2002.

## Vertical Clearance

One bridge along Route 5, BIN 1074270 (Route 5 over CSX Spur Rail Road) does not meet the current 6.71 m ( $22^{\prime}-0$ ") vertical clearance requirements over railroad tracks.

## Interstate LOS

Level of Service (LOS) for interstates is a critical design element. LOS C or better is considered acceptable for urban conditions. LOS D or worse is considered a non-standard feature when occurring on the Interstate system. Based on year 2001 traffic count information, the eastbound movement on Interstate 90 (I-90) between Ridge Road and Route 400 operates at LOS D during the morning peak hour and LOS D during the afternoon peak hour in the westbound direction. In addition, in the eastbound direction the I-90 between Route 400 and I-190 operates at LOS E during the morning peak hour and LOS D during the afternoon peak hour. This segment of I-90 also operates at LOS E in the westbound direction during the afternoon peak hour. In addition, southbound traffic on I-190 operates at LOS D between Bailey Avenue and Smith Street, between Smith Street and Hamburg Street, and between Hamburg Street and Elm/Oak Arterial.

### 2.9.2 Non-Conforming Features

Non-standard features are based upon "Critical Design Elements" identified in section 2.6 of the NYSDOT Design Manual. However, there are other design standards beyond those "Critical Design Elements" which every project must follow. When these design standards are not met they are referred to as "non-conforming". The existing non-conforming features:

## Guide Rail

- Several bridges along Route 5 contain bridge rail installations which are non-conforming because they exceed the current standard 125 mm (5") horizontal curb offset and have vertical posts which do not meet current design standards. These bridges are BIN 1001569 (Rte. 5 over Service Road "D"); BIN 1001559 (Rte. 5 over Conrail Rail Road); BIN 1001549 (Rte. 5 over Ohio Street) and BIN 1001539 (Rte. 5 over Service Road "C").
- Corrugated beam guide rail sections are installed on Route 5 near milepost markers 5-5302-1219 \& 5-5302-1221, adjacent to Buffalo Specialty Products and the railroad
overpass. These are non-conforming features because they do not meet point of need requirements or are installed outside the acceptable installation height requirements.
- All corrugated beam guide railing along Ohio Street between Rigidized Metal and Bulkmatic are non-conforming because they have outdated terminal ends and are in poor condition.
- All guide rail along Bailey Avenue is non-conforming because it is either outdated, in poor condition or does not meet point of need requirements.
- Two crash cushions are installed on Route 5 which are non-conforming because they are an outdated device known as the "Hex-Foam Sandwich System."

## Driveways

- 37 commercial driveways along Route 5 between Mile Strip Road and Ridge Road are non-conforming. Most are non-conforming because they exceed the maximum driveway width. Other driveway locations do not adhere to current design practices as outlined in the "Policy and Standards for Entrances to State Highways" February 1998. Table C2.14-1 "Minor Commercial Driveways Not Meeting Standards" in Section 2.14 of this chapter denote specific standards not met.
- 31 commercial driveways along Ohio Street are non-conforming, the majority of which exceed the maximum driveway width. Further information is found in Table C2.14-1 "Minor Commercial Driveways Not Meeting Standards" in Section 2.14 of this chapter.

## Intersection LOS

Level of Service (LOS) for an intersection is measured for each movement, as well as for the overall operation. LOS D or better is considered acceptable for urban areas. LOS E or worse is considered unacceptable.

- As a signalized intersection, the intersection of Bailey Avenue and Seneca Street operates overall at LOS C during the AM peak hour. However, the northbound approach left turn operates at LOS E.
- As a signalized intersection, the intersection of NYS Route 5 and Lake Avenue operates overall at LOS B during the AM peak hour. However, the westbound approach right turn movement operates at LOS F and the southbound approach left turn operates at LOS E.
- As a signalized intersection, the intersection of NYS Route 5 and Odell Street operates overall at LOS D during the PM peak hour, but the southbound through movement operates at LOS E.
- As a signalized intersection, the intersection of NYS Route 5 and Dona Street operates overall at LOS E during the PM peak hour. In addition, the southbound approach through movement operates at LOS F.
- As a signalized intersection, the intersection of NYS Route 5 and Madison Avenue operates overall at LOS D during the AM peak hour, LOS A during mid-day peak hour and LOS D during PM peak hour. However, both westbound movements (left and right
turns) operate at unacceptable LOS during all peak hour periods. In addition, the southbound through movement in the afternoon peak operates at LOS E.
- The southbound left/through movement of the unsignalized intersection of Ohio Street and Fuhrmann Boulevard SB operates at LOS F during the afternoon peak hour.
- The eastbound left/through movement of the unsignalized intersection of Ohio Street and Michigan Avenue operates at LOS F in both the morning and afternoon peak hours. In addition, the eastbound through/right movement operates at LOS E in the afternoon peak.
- The northbound left/through movement of the unsignalized intersection of Ridge Road and northbound Fuhrmann Boulevard NB currently operates at LOS F.

## Traffic Control Devices

Traffic control devices at primary intersections were evaluated for conformity with applicable guidelines and are described in section 2.13 of this chapter.

### 2.10 Safety Considerations, Accident History, and Analysis

The New York State Department of Motor Vehicles Police Accident Reports were analyzed for the three-year period from September 1997 to August 1999 for all accidents occurring within the study area. The accident information provided a basis for examination of cause and effect.

The detailed accident data found in Attachment C is summarized by severity, type, cause, pavement condition, time of day, day of the week and month of the year. This information is then broken down further as follows. Severity of the crash is divided into three categories: Fatality Crashes, Injury Crashes and Property Damage (Only). Type of crash is classified into eleven categories: Right Angle, Right Turn, Left Turn, Sideswipe, Overtake, Head On, Rear End, Fixed Object, Pedestrian or Bicycle, and Other. Cause of crash is stratified into three major categories: Human, Vehicular and Environmental. These three major categories are then collectively divided into fourteen minor categories: Alcohol Involvement, Driver Inattention, Driver Inexperience, Failure to Yield Right of Way, Fell Asleep, Following Too Closely, Unsafe Speed, Unsafe Lane Change, Other Human, All Vehicular, Obstruction/Debris, Pavement Slippery, Deer/Animal and Other Environmental. Pavement condition is divided into five categories: Dry, Wet, Snow/Ice, Slush and Not Stated. The accident information is graphically depicted in collision diagrams located in Attachment D.

Accident rates were developed from this three-year collection of data and then compared to New York statewide average rates for comparable highways and intersections to identify problem areas. Statewide averages for urban highways and intersections are summarized in Tables $\mathbf{C 2 . 1 0 - 1}$ and C2.10-2 respectively.

Table C2.10-1 - Average Statewide Crash Rates For Urban State Highways

| Access <br> Control | Lanes | Segment Type | All <br> Types | Wet <br> Road | Fixed <br> Object | Injury <br> Type |
| :---: | :--- | :--- | :---: | :---: | :---: | :---: |
| FREE | 2 Lanes - Undivided | Mainline Only | 1.94 | 0.24 | 0.21 | 0.62 |
| FREE | 2 Lanes - Undivided | Mainline \& Junctures | 3.58 | 0.49 | 0.29 | 1.24 |
| FREE | 4 Lanes - Undivided | Mainline Only | 2.49 | 0.34 | 0.12 | 0.80 |
| FREE | 4 Lanes - Undivided | Mainline \& Junctures | 5.57 | 0.78 | 0.20 | 1.93 |
| FREE | All Lanes - Undivided | Mainline Only | 2.12 | 0.27 | 0.19 | 0.68 |
| FREE | All Lanes - Undivided | Mainline \& Junctures | 4.17 | 0.58 | 0.26 | 1.45 |
| FULL | 4 Lanes - Divided | Mainline \& Junctures | 1.39 | 0.17 | 0.23 | 0.48 |
| FULL | 6 Lanes - Divided | Mainline \& Junctures | 2.16 | 0.23 | 0.19 | 0.75 |

Table C2.10-2 - Average Statewide Crash Rates For Intersections

| Intersection Type |  | All <br> Types | Wet <br> Road | Rear <br> End | Injury <br> Type |
| :---: | :---: | :---: | :---: | :---: | :---: |
| \# of Legs | Traffic Control / Lanes |  | 0.41 | 0.06 | 0.10 |
| 3 | signal / 1-4 lanes | 0.16 |  |  |  |
| 3 | signal / w/ left turn / 5 \& > lanes | 0.37 | 0.05 | 0.09 | 0.14 |
| 4 | signal / 1-4 lanes | 0.72 | 0.11 | 0.16 | 0.28 |
| 4 | signal / w/ left turn / 5 \& > lanes | 0.58 | 0.08 | 0.14 | 0.23 |
| 4 | signal / w/o left turn / 5 \& > lanes | 0.42 | 0.05 | 0.09 | 0.16 |

Accident data for I-190 between I-90 and Route 5 is contained in Table C2.10-3. The data is summarized separately for the northbound and southbound directions. For evaluation purposes this segment of I-190 has been divided at milepost markers within each interchange to produce 7 smaller segments for both northbound and southbound directions. As noted in this table, the accident rates for specific roadways segments, as well as wet road type, fixed object type, injury type, and all type (total) were also developed. These rates were then compared with the most recent statewide average rates as denoted previously in Tables C2.10-1 and C2.10-2. Crash rates are shown with shading, where appropriate, to signify a rate that is above the corresponding statewide average rate. Notations are provided to denote the category of highway and therefore the corresponding statewide average crash rate to be used for comparison.

As shown in Table C2.10-3, three of fifty-six accident rates for I-190 are greater than the statewide average. However, it should be noted that the total, overall crash rate for each of the segments is lower than the corresponding statewide average rate. The three accident rates that are higher than the statewide average rates correspond to fixed object crash rates. Specifically, the northbound segment of I-190 between Smith Street and Hamburg Street exhibits a higher than

Table C2.10-3 - Crash Summary (1997-1999) - I-190

| Interstate 190 |  |  |  | Average Crash Rate (acc/mvm) |  |  |  | Number Of Crashes |  |  |  |

|  | MP 0.7 - MP 0.0 | Ogden to I-190 | 3 | 0.05 | 0.05 | 0.00 | 0.05 | 1 | 1 | 0 | 0 |
| Statewide Average |  |  | 3 | 2.16 | 0.23 | 0.19 | 0.75 |  |  |  |  |

$=$ Crash rate above statewide average
1 - Total overall statewide average crash rate $=2.16$
2 - Wet road condition statewide average crash rate $=0.23$
3 - Fixed object statewide average crash rate $=0.19$
4 - Injury type statewide average crash rate $=0.75$
average fixed object crash rate. The fixed object type crash rate within this segment is greater than the statewide average rate by a factor of 1.3. In addition, the southbound segment of I-190 between Route 5 and Elm/Oak exhibits a higher than average fixed object crash rate. This segment of elevated roadway exhibits an S-type curvilinear horizontal alignment, a merge area and a diverge area. The fixed object type crash rate within this segment is greater than the statewide average rate by a factor of 2.9. The third segment of I-190 that exhibits a higher than average fixed object crash rate is between Smith Street and Seneca Street. The fixed object type crash rate within this segment is greater than the statewide average rate by a factor of 1.2.

Table C2.10-4 is a summary of accident information and accident rates by roadway segment along the following highways within the project limits:

- Route 5 between Church Street and Route 179,
- South Park Avenue between Michigan Avenue and Tifft Street,
- Bailey Avenue between Clinton Street and South Park Avenue,
- Ohio Street between Michigan Avenue and Fuhrmann Boulevard,
- Tifft Street between South Park Avenue and Fuhrmann Boulevard, and
- Elk Street between Babcock Street and Bailey Avenue.

| Elk Street | Babcock to Keating ${ }^{2}$ | 2 | 0.78 | 0.00 | 0.78 | 0.78 | 1 | 0 | 0 | 1 |
|  | Keating to Bailey ${ }^{1}$ | 2 | 0.94 | 0.00 | 0.00 | 0.00 | 1 | 1 | 0 | 0 |

[^1]Table C2.10-4 reveals three of thirty-two highway segments exhibiting overall crash rates greater than statewide average. All three are segments of South Park Avenue and are further highlighted in Table C2.10-5.

Table C2.10-5 - Highway Segments With Above Average Crash Rates

| Route | Segment | Actual <br> Overall Crash Rate <br> (acc./mvm) <br> 3-Year Period (1997-1999) | Statewide Overall <br> Average Crash Rate <br> (acc./mvm) <br> 3-Year Period (1997-1999) |
| :---: | :--- | :---: | :---: |
|  | Chicago to Louisiana | 4.34 | 3.58 |
|  | Alabama to Hamburg | 6.52 | 1.94 |
|  | Bailey to Southside | 7.53 | 3.58 |

The crash rate for South Park Avenue between Chicago Street and Louisiana Street is high at $4.34 \mathrm{acc} / \mathrm{mvm}$, which is 1.2 times the statewide average, with three crashes during the three-year period. This segment, similar to the South Park Avenue segment between Hamburg Street and Alabama Street, is located near P.S. 4 and Fulton Academy Complex. The length of this segment is 950 feet. All three crashes were property damage only severity crashes. Two of the three were overtake type crashes and the third was a rear end type. Unsafe lane changes caused two of the three crashes. Two crashes occurred on dry pavement and one on wet pavement. All three occurred after 3 PM. Crashes in this segment were fairly well distributed amongst days of the week and months of the year.

The crash rate for South Park Avenue between Alabama Street and Hamburg Street is high at $6.52 \mathrm{acc} / \mathrm{mvm}$, which is 3.4 times the statewide average, with five crashes during the three-year period. This segment is located near two schools, P.S. 4 and Fulton Academy Complex. The length of this segment is 620 feet. Forty percent of the crashes, (or two crashes), were injury type crashes, which produced an above average injury crash rate of $2.61 \mathrm{acc} . / \mathrm{mvm}$. This rate is 4.2 times the statewide average. No crashes were fatal. Forty percent of the crashes, (or two crashes), were sideswipe type. The major cause of the crashes was unsafe lane changing, which caused three of the five crashes. All five crashes occurred on dry pavement, and occurred between 9 AM and 3 PM. The majority of crashes occurred on Saturday ( $60 \%$ ). Crashes in this segment were fairly well distributed amongst months of the year.

The crash rate for South Park Avenue between Bailey Avenue and Southside Parkway is 7.53 acc/mvm, 2.1 times the statewide average, with 26 crashes during the three-year period. This segment is located near three schools, P.S. 28 and South Park High School and Holy Family School. The length of this segment is 3150 feet. Ten of twenty-six crashes ( $38 \%$ ) were injury type crashes, which produced an above average injury crash rate of $2.90 \mathrm{acc} . / \mathrm{mvm}$. This crash rate is 2.3 times the statewide average. No crashes were fatal. Twenty-three percent of the crashes (or six crashes) were right angle type, $23 \%$ (or six crashes) were rear end type, $19 \%$ (or five crashes) were left turn types, and $12 \%$ (or three crashes) were pedestrian or bicycle type.

Two of the 26 crashes were fixed object type crashes yielding a fixed object type crash rate of $0.58 \mathrm{acc} . / \mathrm{mvm}$, which is 2.0 times the statewide average. Failure to yield right of way was the major cause of crashes forcing eight of the 26 total crashes along this segment. The cause of another eight crashes was attributed to other human factors and four were attributed to unsafe lane changes. Fifty-four percent (or fourteen) of the 26 total accidents occurred on dry pavement, $23 \%$ (or six) on wet pavement and $12 \%$ (or three) on snow/ice. Thirty-eight percent (or ten) of the 26 crashes occurred between 9 AM and 3 PM and $19 \%$ (or five accidents) occurred between 8 PM and midnight. Crashes in this segment were fairly well distributed amongst days of the week and months of the year.

Table C2.10-6 provides the crash numbers and accident rates for 11 major intersections within the project limits during the three-year study period. The intersections are located along Route 5, South Park Avenue, Bailey Avenue, Ohio Street and Tifft Street. Wet road type, rear end type, injury type and all type (Total) crash rates are shown with shading, where appropriate, to signify a rate that is above the corresponding statewide average rate. Notations are provided to denote the category of intersection and therefore the corresponding statewide average crash rates to be used for comparison.

Table C2.10-6 - Crash Summary (1997-1999) - Intersections

| Description |  |  | Average Crash Rate <br> (acc/mev) |  |  |  | Number Of Crashes |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Route | Intersection | $\begin{gathered} \text { \# of } \\ \text { Legs } \end{gathered}$ | Total | Wet | Rear <br> End | Injury | Total | 1997 | 1998 | 1999 |
| Route 5 | Lake Ave. ${ }^{2}$ | 3 | 0.63 | 0.30 | 0.17 | 0.19 | 30 | 15 | 5 | 10 |

|  | Bailey Ave. ${ }^{3}$ | 4 | 0.53 | 0.13 | 0.13 | 0.13 | 8 | 3 | 2 | 3 |
|  | Tifft St. ${ }^{3}$ | 4 | 1.34 | 0.18 | 0.45 | 0.58 | 30 | 9 | 10 | 11 |
| Bailey Ave | Seneca St. ${ }^{4}$ | 4 | 1.52 | 0.34 | 0.54 | 0.68 | 54 | 19 | 21 | 14 |
|  | Elk St. ${ }^{4}$ | 4 | 0.54 | 0.12 | 0.12 | 0.00 | 14 | 5 | 3 | 6 |
|  | McKinley Pkwy. ${ }^{5}$ | 4 | 0.65 | 0.18 | 0.14 | 0.18 | 14 | 2 | 9 | 3 |
| Ohio Street | Michigan St. ${ }^{3}$ | 4 | 0.19 | 0.00 | 0.00 | 0.10 | 2 | 0 | 1 | 1 |
|  | Louisiana St. ${ }^{3}$ | 4 | 0.33 | 0.11 | 0.11 | 0.00 | 3 | 1 | 1 | 1 |
| Tifft Street | Hopkins St. ${ }^{3}$ | 4 | 0.76 | 0.11 | 0.00 | 0.38 | 14 | 8 | 4 | 2 |

[^2]Those intersections which did not have side street approach traffic volumes available are not included in this summary. Intersection crash rates are based upon the annual number of vehicles
entering the intersection and are measured in units of accidents per million entering vehicles (acc/mev). Comparison to average rates is based on New York statewide average crash rates obtained from the New York State Department of Transportation for similar type intersections as noted in Table C2.10-2

Twenty-seven of the forty-four (61\%) crash rates shown in Table C2.10-6 are above their corresponding statewide average. The intersection of Route 5 and Lake Avenue exhibits a wet road type crash rate 6 times the statewide average. This represents the most severe difference in comparison to the statewide average. The rear end type crash rate for this same segment is 2.1 times the state average. The intersection of Bailey Avenue and Seneca Street is notable in that this intersection exhibits either the highest or second highest differential above the corresponding statewide crash rate for each of the four crash type categories. Four intersections have crash rates greater than the state average for all four crash type categories. They are: Route 5 \& Lake Avenue, South Park Avenue \& Tifft Street, Bailey Avenue \& Seneca Street and Bailey Avenue \& McKinley Parkway.

Table C2.10-7 provides the crash rate information for intersections with an overall crash rate above the statewide average. The intersection of Bailey Avenue and Seneca Street, at 2.6 times the statewide average, exhibits the highest overall crash rate differential. The next highest overall crash rate differential, with a rate 1.9 times the statewide average, is located at the intersection of South Park Avenue and Tifft Street.

Table C2.10-7 - Intersections With Above Average Crash Rates

| Description |  | ActualOverall Crash Rate(acc./mev)3-Year Period (1997-1999) | Statewide Overall <br> Average Crash Rate <br> (acc./mev) <br> 3-Year Period (1997-1999) |
| :---: | :---: | :---: | :---: |
| Route | Intersection |  |  |
| Route 5 | Lake Ave. | 0.63 | 0.37 |
| South Park Ave | Michigan Ave. | 0.76 | 0.72 |
|  | Hopkins St. | 0.71 | 0.41 |
|  | Tifft St. | 1.34 | 0.72 |
| Bailey Ave | Seneca St. | 1.52 | 0.58 |
|  | McKinley Pkwy. | 0.65 | 0.42 |
| Tifft Street | Hopkins St. | 0.76 | 0.72 |

The crash rate for the intersection of Route 5 and Lake Avenue is 1.7 times the statewide average at $0.63 \mathrm{acc} . / \mathrm{mev}$, with 30 crashes during the three-year period. Nine of thirty crashes ( $30 \%$ ) were injury type crashes, which produced an above average injury crash rate of $0.19 \mathrm{acc} . / \mathrm{mev}$, or 1.4 times the statewide average. No crashes were fatal. Fifty percent of the crashes (or fifteen crashes) were left turn type, $27 \%$ (eight crashes) were rear end type and $13 \%$ (four crashes) were overtake type. The rear end type crash rate at this intersection of $0.17 \mathrm{acc} . / \mathrm{mev}$ is 1.9 times the statewide average. Failure to yield right of way was the major cause of crashes leading to 17 of
the 30 total crashes at this intersection. The cause of another five crashes was attributed to other human factors and four were attributed to unsafe lane changes. Forty-seven percent (or fourteen) of the 30 total crashes occurred on wet pavement, yielding a crash rate ( $0.30 \mathrm{acc} . / \mathrm{mev}$ ), which is 6.0 times the statewide average. Forty-three percent (or thirteen) of the 30 crashes occurred between 9 AM and 3 PM, and 20\% (or six crashes) occurred between 6 AM and 9 AM. Crashes in this segment were fairly well distributed amongst days of the week with the greatest number of crashes (seven) occurring on Thursday. Crashes in this segment were fairly well distributed amongst months of the year as well, with the greatest number of crashes (seven) occurring in January.

The crash rate for the intersection of South Park Avenue and Michigan Avenue is 1.1 times the statewide average at $0.76 \mathrm{acc} . / \mathrm{mev}$, with nine crashes occurring during the three-year period. Five of the nine crashes (56\%) were injury type crashes, which produced an above average injury crash rate of $0.42 \mathrm{acc} . / \mathrm{mev}$, or 1.5 times the statewide average. No crashes were fatal. Forty-four percent of the accidents (or four) were right angle type, $22 \%$ (or two) were left turn type and $22 \%$ (or two) were overtake type. Failure to yield right of way was the major cause of crashes leading to six of the nine total crashes at this intersection. The cause of another two crashes was attributed to unsafe lane change and one crash was attributed to driver inattention. Five of nine crashes occurred on dry pavement, and four of nine occurred on wet pavement, thus yielding a wet pavement type crash rate ( $0.34 \mathrm{acc} . / \mathrm{mev}$ ) that is 3.1 times the statewide average. Four of nine crashes occurred between 3 PM and 6 PM and the other five were distributed amongst the other times of day. Crashes in this segment were fairly well distributed amongst days of the week and months of the year.

The crash rate for the intersection of South Park Avenue and Hopkins Street is 1.7 times the statewide average at $0.71 \mathrm{acc} . / \mathrm{mev}$, having nine crashes during the three-year period. Four of the nine crashes ( $44 \%$ ) were injury type crashes producing an above average injury crash rate of 0.32 $\mathrm{acc} . / \mathrm{mev}$, or 2.0 times the statewide average. No crashes were fatal. Four of nine crashes were rear end type, $22 \%$ (or two) were right turn type and $22 \%$ (or two) were overtake type. The cause of four crashes was attributed to other human factors and two were attributed to unsafe lane changing. The rear end type crash rate at this intersection is $0.32 \mathrm{acc} . / \mathrm{mev}$, which is 3.2 times the statewide average. Eight of nine crashes occurred on dry pavement. Crashes in this segment were fairly well distributed amongst times of the day, days of the week, and months of the year.

The crash rate for the intersection of South Park Avenue and Tifft Street, which had thirty crashes during the three-year study period is 1.9 times the statewide average at $1.29 \mathrm{acc} / \mathrm{mev}$. Thirteen of 30 crashes ( $43 \%$ ) were injury type crashes, producing an above average injury crash rate of $0.58 \mathrm{acc} . / \mathrm{mev}$, or 2.1 times the statewide average. No crashes were fatal. Thirty-four percent of the crashes (ten crashes) were rear end type, 27\% (eight crashes) were right angle type and $23 \%$ (seven crashes) were left turn type. Failure to yield right of way was the major cause of crashes leading to 13 of the 30 total crashes at this intersection. The cause of another nine crashes was attributed to other human factors. Nineteen of thirty ( $63 \%$ ) crashes occurred on dry pavement, and four of thirty occurred on wet pavement, yielding a wet pavement type crash rate
( $0.18 \mathrm{acc} . / \mathrm{mev}$ ) that is 1.6 times the statewide average. Eleven of 30 crashes occurred between 9 AM and 3 PM and the other nineteen crashes were distributed amongst the other times of day. Crashes in this segment were fairly well distributed amongst days of the week and months of the year.

The crash rate for the intersection of Bailey Avenue and Seneca Street is 2.6 times the statewide average at $1.52 \mathrm{acc} . / \mathrm{mev}$, with 54 crashes during the three-year period. Forty-four percent of the 54 crashes were injury type crashes, which produced an above average injury crash rate of 0.68 acc./mev, or 3.0 times the statewide average. No crashes were fatal. Nineteen of the 54 crashes were rear end type and yielded a crash rate of $0.54 \mathrm{acc} . / \mathrm{mev}$. This is 3.9 times the statewide average. Thirty-five percent of the crashes (or nineteen crashes) were left turn type and $20 \%$ (or eleven crashes) were right angle type. Failure to yield right of way was the major cause of crashes leading to 30 of the 54 total crashes at this intersection. The cause of another eleven of the crashes was attributed to other human factors. Fifty-nine percent of the 54 crashes (or thirtytwo crashes) occurred on dry pavement, and twelve of 54 occurred on wet pavement. The wet pavement type crash rate ( $0.34 \mathrm{acc} . / \mathrm{mev}$ ) was 4.3 times the statewide average. Thirty-three percent of crashes (or eighteen) occurred between 9 AM and 3 PM and 20\% (or eleven) occurred between 6 AM and 9 AM. Crashes in this segment were more prevalent on weekdays and during the summer months.

The crash rate for the intersection of Bailey Avenue and McKinley Parkway, which had fourteen crashes during the three-year study period is 1.5 times the statewide average at $0.60 \mathrm{acc} . / \mathrm{mev}$. Four of fourteen crashes (29\%) were injury type crashes, producing an above average injury crash rate of $0.18 \mathrm{acc} . / \mathrm{mev}$, or 1.1 times the statewide average. No crashes were fatal. Twentynine percent of the fourteen crashes (or four) were right turn type, three were rear end type, two were left turn type, and two were overtaking type accidents. Unsafe lane changing was the major cause of crashes leading to four of the fourteen total crashes at this intersection. The cause of another three crashes was attributed to failure to yield right of way and another three were attributed to other human factors. Four of fourteen ( $29 \%$ ) crashes occurred on dry pavement, and four of fourteen occurred on wet pavement, which yielded a wet pavement type crash rate $(0.18$ acc. $/ \mathrm{mev}$ ) that is 3.6 times the statewide average. The time of day most crashes occurred was between 9 AM and 3 PM. Crashes in this segment were fairly well distributed throughout the week and throughout the year.

The crash rate for the intersection of Tifft Street and Hopkins Street is 1.1 times the statewide average at $0.76 \mathrm{acc} . / \mathrm{mev}$, with fourteen crashes occurring during the three-year period. Half of the crashes (or seven crashes) were injury type crashes, which produced an above average injury crash rate of $0.38 \mathrm{acc} . / \mathrm{mev}$, and resulted in a rate 1.4 times the statewide average. No crashes were fatal. Forty-three percent of the crashes (or six) were rear end type and $29 \%$ (or four) were right angle type. Failure to yield right of way lead to five of the fourteen total crashes at this intersection. The cause of another 7 crashes was attributed to other human factors. Nine of fourteen ( $64 \%$ ) crashes occurred on dry pavement, and two of fourteen occurred on wet
pavement. Crashes in this segment were fairly well distributed amongst the times of day, days of the week, and months of the year.

## Summary

Crash data, including causes and effect, was analyzed for each of the forty-six highway segments and the eleven intersections, chosen for their individual characteristics in an effort to simplify the crash analysis for the three-year study period from 1997 through 1999.

Of the forty-six highway segments examined, three were found to have higher than average overall crash rates, as shown in Table C2.10-4. All three of these segments are located on South Park Avenue. One is the segment between Chicago Street and Louisiana Street (1.2 times the statewide average) the second is between Alabama Street and Hamburg Street ( 3.4 times the statewide average) and the third is between Bailey Avenue and Southside Parkway (2.1 times the statewide average).

Of the eleven intersections examined, seven were found to have higher than average overall crash rates, as shown in Table C2.10-6. The seven intersections are as follows:

- Route 5 \& Lake Ave.
- South Park Ave. \& Michigan Ave.
- South Park Ave. \& Hopkins St.
- South Park Ave. \& Tifft St.
- Bailey Ave. \& Seneca St.
- Bailey Ave. \& McKinley Pkwy.
- Tifft St. \& Hopkins St.
(1.7 times the statewide average)
(1.1 times the statewide average)
(1.7 times the statewide average)
(1.9 times the statewide average)
(2.6 times the statewide average)
(1.5 times the statewide average)
(1.1 times the statewide average)

There were three fatal type crashes that occurred within the study area during the three-year analysis period. In 1997, there was a fatal crash on I-190 southbound between Route 5 and the Elm/Oak interchange. In 1998, there was a fatal crash along Route 5 between Tifft Street and Ridge Road. In 1999, there was a fatal crash at the intersection of Route 5 and the entrance to the Bethlehem Steel Plant.

A location with an overall crash rate of 2.5 times the statewide average or greater is designated a Priority Investigation Location (PIL). Two locations in the study area are identified as PIL's. One location is the intersection of Bailey Avenue and Seneca Street. In addition to its high overall crash rate, this intersection had an injury severity crash rate of 3.0 times the statewide average, a rear end type crash rate of 3.9 times the statewide average, and a wet pavement crash rate of 4.3 times the statewide average. The major cause of crashes within this location is failure to yield right of way, which contributed to $56 \%$ of the 54 crashes.

The other location within the project with a PIL designation is the street segment of South Park Avenue between Alabama Street and Hamburg Street, which had an overall crash rate 3.4 times
the statewide average rate. In addition, this segment of roadway had an injury severity crash rate of 4.2 times the statewide average. The major cause of crashes within this location was unsafe lane changing, causing three of the five total crashes, which occurred within this segment during the three-year study period.

### 2.11 Pavement and Shoulder Considerations

The NYSDOT rating system for pavement surface ranges from 1 (poor - impassable at posted speed) to 10 (excellent - no distress, recently constructed or reconstructed). Pavement condition ratings are further discussed in Table C2.11-1.

Table C2.11-1 - Generalized Descriptions of Pavement Condition Ratings

| General Score Condition |  | Condition Surface Rating Description |
| :---: | :---: | :---: |
| Poor | 1 | Pavements are in extremely deteriorated condition and are in need of immediate corrective action. These facilities are considered impassable at posted speeds. |
|  | 2 | Pavements are in extremely deteriorated condition and may require complete reconstruction. Motorists experience discomfort and travel speeds will decrease. |
|  | 3 | Pavements have deteriorated to a point where resurfacing is required immediately. Flexible pavements show evidence of severe and frequent scaling, joint spalling, faulting cracking, and patching. Rigid pavements show signs of frequent and severe joint spalling, cracking and scaling. |
|  | 4 | Pavements have deteriorated to a point where resurfacing is required, showing occasional to frequent distress. Readability, even at slow speeds, is impaired. Surface defects on flexible pavements include sever rutting, cracking, raveling, and patching. Surface defects of rigid pavements include severe joint spalling, cracking, scaling, and patching. Overlay pavements show evidence of severe surface delamination. |
|  | 5 | Riding quality is noticeably inferior to new pavements but may be tolerable for high-speed traffic. Pavements show occasional to frequent signs of distress. Surface defects of pavements are the same as under the 6 rating but are more severe. |
| Fair | 6 | Riding quality is noticeably inferior to new pavements, showing infrequent to occasional signs of distress. Surface defects of flexible pavements may include moderate rutting, cracking, and raveling: patching is apparent. Overlay pavements show evidence of slight to moderate cracking and raveling along cracks. |

Table C2.11-1 - Generalized Descriptions of Pavement Condition Ratings Continued

| General Score <br> Condition |  | Condition Surface Rating Description |
| :---: | :---: | :--- |
| Good | 7 | Pavements give a good ride but show infrequent to occasional signs of <br> surface deterioration. Flexible pavements show evidence of slight rutting, <br> random cracking and some raveling. Rigid pavements show evidence of <br> slight joint spalling, scaling, or minor cracking. Overlay pavements show <br> evidence of slight reflection cracking and multiple cracking at reflection <br> cracks. |
|  |  | 8 | | Pavements give an excellent ride but show infrequent to occasional signs of |
| :--- |
| surface deterioration. Flexible pavements begin to show very slight evidence |
| of raveling, cracking, and wheel track wear. Rigid pavements begin to show |
| very slight evidence of surface deterioration such as cracking, joint spalling, |
| or scaling. Overlay pavements show evidence of very slight reflection |
| cracking. |\(\left|\begin{array}{l}Eavement has no cracks or patches. Flexible pavement recently resurfaced <br>

within the past year or two. Overlay pavements may show evidence of some <br>

hairline reflection cracking. Rigid pavement joints function properly.\end{array}\right|\)| Excellent |
| :--- |
| 10 |
| There are no visual derivations from a smooth surface. Pavement recently |
| constructed, reconstructed, or overlaid. |

Existing pavement conditions were evaluated within the project area. Year 2001 Pavement Scores are noted in Table C2.11-2.

Table C2.11-2 - 2001 Pavement Sufficiency Rating

| Route | Segment | 2001 Pavement <br> Sufficiency <br> Rating |
| :--- | :--- | :---: |
| Route 5 | I-190 to Ridge Road | 9 |
|  | Ridge Road to Mile Strip | 6 |
| Fuhrmann Blvd | I-190 to Ridge Road | 6 |
| South Park Ave | Michigan Avenue to Bailey Ave | 5 |
|  | Bailey Ave to Ridge Road | 6 |
| Mile Strip | Route 5 to South Park | 10 |

Existing pavement conditions for additional roadways within the project area are described in section 2.5 of this chapter.

### 2.12 Guide Railing, Median Barrier, and Impact Attenuators

### 2.12.1 Guide Railing

Detailed information pertaining to existing guide rail in the project area, including location, rail or barrier type, condition, mount height and adherence to current design standards is outlined in Table C2.12-1. Summaries from that table are noted below.

## Route 5-Skyway

Guide rail along the highway section of the Skyway is mostly W-beam, with some box beam guide rail installed near the Union Ship Canal. The barrier is generally in good condition with the exception of some warped sections caused by differential road settlement near the Father Baker Memorial Bridge. The barrier in this area can be reset to bring the rail height within acceptable installation tolerances. Some roadside slopes at the gore areas are not adequately protected.

Bridge railing along the Skyway portion of the project area is either box beam or concrete barrier. Two-rail bridge rail is installed at four locations (MP 5-5302-3012, MP 5-5302-3016, MP 5-5302-3018 and MP 5-5302-3021) and is in good condition, however, it does not meet current design standards. Concrete barrier is installed at three locations (MP 5-5302-3002, MP 5-5302-3003 and 5-5302-3005) and is in good condition.

## Route 5 to Mile Strip Road - Hamburg Turnpike

Highway guide rail along the Hamburg Turnpike portion is of varying condition. New box beam guide rail was installed near the Smokes Creek Bridge in year 2001 and is in good condition.

At the Bethlehem Steel railroad overpass, W-beam is installed on the west side of the roadway and is bolted to the face of the abutment wall with no deflection distance provided. It does not meet current design standards. Box beam guide rail is installed on the east side of the overpass that does meet current installation standards.

W-beam guide rail is installed near Buffalo Specialty Products to protect motorists from a drainage ditch. This rail does not meet current installation requirements.

## Fuhrmann Boulevard

Guide rail along Fuhrmann Boulevard in both northbound and southbound directions is either Wbeam or wood posts. The rail is in poor condition and does not meet current design standards.

## South Park Avenue

Highway guide rail along South Park Avenue is either box beam, 4-rail bridge rail or a miscellaneous installation. The majority of the rail is in poor condition and does not meet current design standards. Very poor guide rail conditions exist around the Lift Bridge with severely inadequate protection of the concrete walls east of the Lift Bridge, and only chain link fence on the southwest approach to the Lift Bridge.

Bridge rail on South Park Avenue is either 4-rail or concrete barrier and generally is in good condition meeting current design standards, with the exception of the transitions from 4-rail to box beam guide rail.

## Ohio Street

Scattered installations of highway guide rail exist along Ohio Street. Short sections of guide rail in poor condition are located in front of Rigidized Metal, Casual Dining and Bulkmatic Corporation. These are in need of replacement. The box beam and W-beam guide rail surrounding the bridge over the Conrail Railroad tracks are in good condition and meet current design standards.

Bridge rail on Ohio Street is concrete barrier, in good condition, and meets current design standards.

## Bailey Avenue

Both highway guide rail and bridge rail along this roadway are in poor condition, damaged to some extent, and do not meet current design standards. Motorists are not adequately protected from roadside hazards such as signs, embankment slopes, and bodies of water.

## Hopkins Street

The highway guide rail north of the bridge on both the east and west sides is damaged and is in need of maintenance. Also some end assemblies are needed to bring this section of rail up to current design standards. The highway rail south of the bridge is in good condition and meets current design criteria.

Bridge rail on Hopkins Street is generally is in good condition, but does not meet current design standards.

## Tifft Street

The highway guide rail located at the entrance to the C\&D Transfer has suffered recent strikes and is damaged. Maintenance on this section would be adequate to return it to normal operating
state. Otherwise, highway and bridge guide rails on Tifft Street are in good condition and meet current design standards.

Seneca Street, Elk Street, Keating Street, Lake Avenue
There are no existing guide rails along these corridors within the project area.

### 2.12.2 Median Barrier

Route 5 - From Skyway to Hamburg Turnpike
Median barrier is installed the entire length of the Route 5 Skyway portion of the project area. It is concrete median barrier and is in good condition.

### 2.12.3 Impact Attenuators

Route 5-From Skyway to Hamburg Turnpike
Two crash cushions are installed on the Route 5 Skyway corridor and are the "Hex-Foam Sandwich System." They both have minor damage, requiring normal maintenance to repair. However, this impact attenuator is an outdated device.

| Location |  |  |  |  | Type of Barrier | Physical Condition |  |  |  | Notes | Summary / Recommendations |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 2.13 Traffic Control Devices (signs, signals, etc.)

Traffic control at intersections within the project area selected for the purpose of analyzing traffic operations is as noted in Table C2.13-1. Figure C2.13-1 also depicts the locations of all signalized intersections in the study area.

Table C2.13-1 - Traffic Control at Selected Intersections

| Route | Intersection | Type of Control |
| :--- | :--- | :--- |
| Route 5 | Odell Street | Signalized |
|  | Dona Street | Signalized |
|  | Madison Ave | Signalized |
|  | Lake Ave | Signalized |
| Fuhrmann Blvd - NB | Ohio Street | Stop sign on Fuhrmann Blvd NB to make left; <br> yield to make left from Fuhrmann Blvd SB onto <br> Ohio Street |
|  | Tifft Street \& Route 5 exit ramp | Stop sign from Route 5 exit ramp |
|  | Ridge Road (ramps to Route 5) | Stop sign from Route 5 exit ramp |
|  | Ohio Street | Stop sign on Fuhrmann Blvd SB to make left <br> towards Ohio Street |
|  | Tifft \& Route 5 entrance ramp | Signalized |
|  | Ridge Road (ramps to Route 5) | Stop signs from Fuhrmann Blvd and Ridge Road |
|  | Michigan Ave | Signalized |
|  | Smith Street | Signalized |
|  | Hopkins Street | Signalized |
|  | Bailey Avenue \& Abbott Road | Signalized |
|  | Tifft Street | Signalized |
| Ohio Street | Michigan Ave | Stop signs from Ohio St NB and parking lot SB |
|  | Louisiana Street | Signalized |
|  | McKinley Parkway | Signalized |
|  | Elk Street | Signalized |
|  | Seneca Street | Signalized |
| Tifft Street | Hopkins Street | Signalized |

## MUTCD Conformity

Traffic control devices at primary intersections were evaluated for conformity with the New York State Manual on Uniform Traffic Control Devices (NYS MUTCD, 2001) guidelines.

## Bailey Avenue and Seneca Street

Two non-conforming features were identified at this intersection according to the NYS MUTCD guidelines. The northbound and southbound approach lenses are currently 8 inches in diameter. However, these lenses should be 12 inches in diameter as they are located greater than 80 feet from the stop bar on the approaches that they control.

## Bailey Avenue and Elk Street

All signal features at this intersection are in conformance with MUTCD guidelines.

## Bailey Avenue and McKinley Parkway

This intersection has only one non-conforming feature. The north-eastbound approach (Bailey Avenue approach) is required to have at least one signal head 40 feet or more from the stop bar on this approach. However, the furthest signal from the stop bar was measured to be approximately 35 feet away. This measurement was based on an approximate location of the stop bar because no stop bar exists at this approach.

## Bailey Avenue, South Park Avenue and Abbott Road

This intersection has two non-conforming features. The north-westbound approach (South Park Avenue approach) is required to have at least one signal head 40 feet or more from the stop bar. However, the furthest signal from the stop bar was measured to be only 13.5 feet away. In addition, approaches are also required to have at least 15 feet of longitudinal clearance between the stop bar and the closest or nearest signal head. Yet, as mentioned earlier, the distance between the signal and the stop bar was measured to be only 13.5 feet.

## South Park Avenue and Hopkins Street

The westbound approach (South Park Avenue approach) carries a non-conforming feature because it should have at least 40 feet of longitudinal spacing to its controlling signal head. However, only 20 feet is provided from the approximate location of the stop bar. This measurement is approximate, as there is currently no stop bar on this approach.

## Tifft Street and Hopkins Street

The westbound (Tifft Street) approach of this intersection also has non-conforming features because the approach does not fulfill the minimum longitudinal signal offset requirements (at

least 15 feet and greater than 40 feet) from the stop bar. The approach has two signal heads located 14 and 26 feet respectively from the stop bar.

South Park Avenue and Tifft Street
All signal features at this intersection are in conformance with MUTCD guidelines.
South Park Avenue and Smith Street
All signal features at this intersection are in conformance with MUTCD guidelines.
South Park Avenue and Michigan Avenue
All signal features at this intersection are in conformance with MUTCD guidelines.
Fuhrmann Boulevard (Southbound) and Tifft Street
All signal features at this intersection are in conformance with MUTCD guidelines.
Ohio Street and Louisiana Street
All signal features at this intersection are in conformance with MUTCD guidelines.

## Route 5 and Lake Avenue

All signal features at this intersection are in conformance with MUTCD guidelines.

## Michigan Avenue and Ohio Street

There are features that are not in conformance with MUTCD on the eastbound and westbound approaches. The stop signs are located adjacent to the stop bar. The MUTCD recommends locating the stop signs four feet in front of the stop bar.

## Furhmann Boulevard Northbound and Tifft Street

There is no Keep Right sign located on the west end of the curbed median that is located on the east leg of the intersection. This does not conform to the MUTCD.

## Furhmann Boulevard Northbound and Ridge Road

All sign features at this intersection are in conformance with MUTCD guidelines. Although, the stop bar located on the northbound approach for left/thru turning vehicles crosses the pedestrian path between handicap ramps. No crosswalk is delineated for this pedestrian crossing.

## Furhmann Boulevard Southbound and Ridge Road

There is no sign to warn motorists of the lane reduction on the southbound departure of the intersection. All other sign features conform to MUTCD.

## Fuhrmann Boulevard Northbound and Ohio Street

All sign features at this intersection are in conformance with MUTCD guidelines.

## Fuhrmann Boulevard Southbound and Ohio Street

There is no sign to warn motorists of the southbound lane reduction to the south of the intersection. Nor is there a sign to warn motorists of the lane merge on the southbound departure of the intersection. All other sign features conform to MUTCD.

### 2.14 Commercial Driveways

The NYSDOT's Policy and Standards for Entrances to State Highways, February 1998 reports design requirements for residential and commercial driveways. Commercial driveways are broken down into two categories, major and minor driveways. A major commercial driveway is considered to be any commercial driveway where the anticipated traffic volume on a typical day is either: a.) 100 or more one-way trips during the peak hour for either the adjacent roadway or the development, or b.) 50 or more one-way trips during the $8^{\text {th }}$ highest hour of annual driveway activity. A minor commercial driveway is considered to be any commercial driveway where the anticipated traffic volume on a typical day is less than the values stipulated for a major commercial driveway. It was determined, that there are no major commercial driveways within the study area. The NYSDOT standards for minor and major commercial driveways are provided below in Table C2.14-1.

Table C2.14-1 - NYSDOT Minor and Major Commercial Driveway Standards

| Commercial Type | $\underset{\substack{\text { (1-way) } \\ \text { ft }}}{\text { W }}$ | $\underset{\substack{\text { (2-way) } \\ \text { ft }}}{\text { W }}$ | Distance btwn $W_{1} \& W_{2}$ (1-way) ft | Distance btwn $\mathrm{W}_{1} \& \mathrm{~W}_{2}$ (2-way) ft | Corner <br> Angle ${ }^{4}, \theta$ <br> degrees | Distance to signalized intersection ft | Distance to unsignalize d intersection ft | Distance to property line ft | Curb height at sidewalk in | $\begin{gathered} \text { Slope }^{5} \\ \% \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| minor | $16^{1}$ | $24^{2}$ | $30^{3}$ | $75^{3}$ | 90 | 100 | $\begin{gathered} \hline(2 \times W)+1 \\ 5 \\ \hline \end{gathered}$ | 5 | 1 | 6 |
| major | 12/lane | 12/lane | $30^{3}$ | $75^{3}$ | 90 | 100 | $\begin{gathered} \hline(2 \times W)+1 \\ 5 \\ \hline \end{gathered}$ | 5 | 1 | 6 |

${ }^{1}$ The standard width of a 1-way minor commercial driveway is 16 ft , but $12 \mathrm{ft}-24 \mathrm{ft}$ widths are permissible.
${ }_{3}^{2}$ The standard width of a 2-way minor commercial driveway is 24 ft , but $22 \mathrm{ft}-30 \mathrm{ft}$ widths are permissible.
${ }^{3}$ Only one driveway permitted unless operational need can be substantiated.
${ }_{5}^{4}$ A $90^{\circ}$ corner angle is standard, but $60^{\circ}-120^{\circ}$ angles are permissible.
${ }^{5}$ A $10 \%$ slope is allowed in rural areas, and a $6 \%$ slope is allowed in urban areas. This project lies entirely in urban areas.

Existing commercial driveway geometry was collected for the following roadway segments, as summarized in Table C2.14-2, to evaluate compliance with current NYSDOT standards:

- Route 5 between Ridge Road and Route 179,
- Ohio Street between Michigan Avenue and Fuhrmann Boulevard,
- Fuhrmann Boulevard between Michigan Avenue and Ridge Road,
- Keating between Seneca Street and Elk Street,
- South Park Avenue between the Buffalo River and Hopkins Street, and
- Tifft Street between Fuhrmann Boulevard and Hopkins Street.

Geometry data included driveway width, corner angle, access control (medians, curbs, etc), spacing from side roads, and distance from the edge of property. These field measurements were then compared to the NYSDOT standards for the appropriate commercial driveway type to determine compliance with current standards. Table C2.14-3 notes that compliance for specific driveways within the project. In addition, Attachment $\mathbf{E}$ contains complete detailed driveway geometry for the commercial driveways evaluated.

As shown in Table C2.14-3, one hundred twenty-eight (128) of the 164 minor commercial driveways were found to exceed at least one NYSDOT standard. This table shows that ninetyone (91) of the 164 minor commercial driveways do not meet the NYSDOT standards for driveway width. Forty-four (44) driveways do not meet standards for distances between driveways, twenty-six (26) are too close to the nearest intersection and thirty-two (32) exceed the standards for driveway slope. Thirty-six (36) driveways within the study area appear to be within 5 feet of the property line, although many property lines were difficult to identify during the field visit. On the other hand, none of the minor commercial driveways exceed the permissible corner angle or the 1 inch standard for curb height at the sidewalk.

Appendix C: Traffic \& Accident Report Chapter 2: Existing Features/Conditions

Table C2.14-2 - Minor Commercial Driveway Measurements By Segment

| Route | Segment | Total \# of Driveways | Number Of Driveways Not Meeting NYSDOT Standards |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 2.15 Structures

The following are the eighteen existing bridge structures within the project limits. They are further highlighted in Figure C2.15-1.

1. BIN 2256770, South Park Avenue over CSX Railroad
2. BIN 2257540, South Park Avenue over Norfolk Southern and CSX Railroads
3. BIN 2260650, South Park Avenue over Buffalo River
4. BIN 2028330, Bailey Avenue over Buffalo River
5. BIN 2028320, Bailey Avenue over Cazenovia Creek
6. BIN 2260430, Ohio Street over Buffalo River
7. BIN 2260620, Ohio Street over CSX Railroad
8. BIN 1001569, Route 5 over Service Road "D"
9. BIN 1001559, Route 5 over Conrail Railroad
10. BIN 1001549, Route 5 over Ohio Street
11. BIN 1001539, Route 5 over Service Road "C"
12. BIN 1074280, Route 5 over Tifft Street
13. BIN 1074270, Route 5 over CSX Spur Railroad
14. BIN 1001520, Route 5 over Union Ship Canal
15. BIN 1074260, Route 5 over Ridge Road
16. BIN 1001490, Route 5 over Smokes Creek
17. BIN 1001439, Route 5 over Mile Strip
18. BIN 1001429, Route 5 over Mile Strip

Tables C2.15-1a and C2.15-1b summarize the history, characteristics, geometrics, condition, load rating, and maintenance responsibility for the eighteen structures. The FHWA Federal Sufficiency Rating ranges from 0 to 100. Bridges scoring under 80 are eligible for rehabilitation or replacement funds. The NYSDOT Condition Rating is a weighted average of individual ratings for different bridge components. The NYSDOT Condition Ratings are:

1. Potential Hazards
2. Used to Shade Between a Rating of 1 and 3
3. Serious Deterioration or Not Functioning as Originally Designed
4. Used to Shade Between a Rating of 3 and 5
5. Minor Deterioration, Functioning as Originally Designed
6. Used to Shade Between a Rating of 5 and 7
7. New Condition
8. Not Acceptable
9. Unknown

Tables C2.15-2a and C2.15-2b summarize the numerical ratings from the most recent inspections. The ratings reference a scale of 1 to 7 , with 1 being in very poor condition, 3 requiring major repairs and 7 signifying in new condition. A rating of 8 refers to items not applicable to the specific structure while a rating of 9 refers to items that are not inspectable.

The eighteen bridges all fall within Seismic Performance Category "B" and are classified as "Functionally Important". Americans with Disabilities Act (ADA) rules do not apply on the NYS Route 5 structures because pedestrians and bicyclists are prohibited from traversing limited access highways. Where pedestrians and bicyclists are permitted, (structures BIN 2256770, BIN 2257540, BIN 2260650, BIN 2028330, BIN 2028320 and BIN 2260430), all applicable ADA rules must be followed.

### 2.16 Provisions for Pedestrians and Bicyclists

## Sidewalk Locations

Sidewalks are provided along all roadways in the study area with the exception of Fuhrmann Boulevard, Lake Avenue, Mile Strip, and parts of Ohio Street. Table C2.16-1 lists the sidewalk locations in the project area.

Table C2.16-1 - Sidewalk Locations

| Route |  | Location |
| :--- | :--- | :---: |
| Route 5 | Segment | East side |
|  | Ridge Rd. to Buffalo Specialty Products Inc. | Buth sides |
| Ohio St | Buffalo Specialty Products Inc. to Mile Strip Exp. | Both Park Ave |
|  | Michigan Ave. to Ridge Rd. | East side |
|  | Miami St. to Chicago St. | East side |
|  | South St. to Louisiana St. | Both sides |
|  | Louisiana St. to Ganson St./Childs St. | East side |
| Louisiana St | South Park Ave. to Ohio St. | Both sides |
| Smith St | Elk St. to South Park Ave. | Both sides |
| Keating St | Seneca St. to Elk St. | Both sides |
| Bailey Ave | Clinton St. to South Park Ave. | Both sides |
| Hopkins St | South Park Ave. to Tifft St. | Both sides |
|  | Tifft St. to Ladner Ave. | East side |
|  | Larrabee St. to RR Tracks | East side |
| Seneca St | Babcock St. to Elk St. | Both sides |
| Elk St | Babcock St. to Seneca St. | Both sides |
| Tifft St | Fuhrmann Blvd. to Hopkins St. | North side |
|  | Hopkins St. to South Park Ave. | Both sides |
| Ridge Rd | Fuhrmann Blvd. to RR Tracks | Both sides |
| Lake Ave | RR Tracks to RR Tracks | South side |

Pedestrian provisions are noted in Table C2.16-2, as well as being described as follows:

## Crosswalk Locations

Pedestrian crosswalks are provided across all legs of the following intersections:

- Route 5 at Fourth Street, and Hawley Street,
- South Park Avenue at Michigan Avenue, Southside Parkway, Tifft Street, Choate, the Police Athletic League, Marilla Street, Lake Ave, and Mile Strip Road,
- Ridge Road at Electric Avenue,
- Bailey Avenue at Elk Street and McKinley Parkway,
- Seneca Street at Babcock Street,
- Elk Street at Smith Street, and
- Hopkins Street at Tifft Street and Good Avenue.

Pedestrian crosswalks are provided across selected legs of the following intersections:

- Route 5 at Odell Street, Dona Street, Madison Avenue, and Lake Avenue,
- South Park Avenue at Harvey Place, Euclid Street, Bailey Avenue/Abbott Road, Verona Street, Good Avenue, and McKinley Parkway,
- Ridge Road at Franklin Street and Victory Avenue,
- Ohio Street at Michigan Avenue,
- Bailey Avenue at Seneca Street,
- Okell Street at South Park Avenue,
- Center Street at Ridge Road,
- Littel Avenue at Bailey Avenue, and
- Minton Street at Seneca Street

Manual push button controllers assist pedestrian traffic across all legs of the following intersections:

- South Park Avenue at Alabama Street, Hamburg Street, Bailey Avenue/Abbott Road, Tifft Street, the Police Athletic League, Lake Avenue, and Mile Strip,
- Bailey Avenue at Seneca Street and McKinley Parkway, and
- Seneca Street at Smith Street.

Manual push button controllers assist pedestrian traffic across selected legs of these intersections:

- Route 5 at Odell Street, Dona Street, Madison Avenue, Lake Avenue, Fourth Street, and Hawley Street,
- Tifft Street at Fuhrmann Boulevard SB,
- South Park Avenue at Michigan Avenue, Elk Street, Lee Street, Germania Street, Hopkins Street, Southside Parkway, Choate, and Marilla Street,
- Ohio Street at Ganson Street,
- Bailey Avenue at Elk Street, and
- Hopkins Street at Good Avenue.

Pedestrian signals without manual push buttons are provided at the intersection of Bailey Ave and Clinton Street.

Table C2.16-2 - Pedestrian Provisions

| Route | Intersection | Crosswalk |  | Manual Push Button |  | Pedestrian Signal |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\begin{gathered} \text { All } \\ \text { Legs } \end{gathered}$ | Selected <br> Legs | $\begin{gathered} \hline \text { All } \\ \text { Legs } \\ \hline \end{gathered}$ | $\begin{gathered} \hline \text { Selected } \\ \text { Legs } \\ \hline \end{gathered}$ | $\begin{gathered} \text { All } \\ \text { Legs } \end{gathered}$ | $\begin{gathered} \hline \text { Selected } \\ \text { Legs } \\ \hline \end{gathered}$ |

|  | Franklin St |  | X |  |  |  |  |
|  | Electric Ave | X |  |  |  |  |  |
|  | Victory Ave |  | X |  |  |  |  |

## Bicycle Traffic

Bicycle traffic is accommodated via a bike lane in both directions along Tifft Street between the George Hartman Playing Fields and the driveway for Modern Recycling. Pedestrian and bicycle traffic on Route 5 from the Skyway to Ridge Road is prohibited. According to the NYSDOT Highway Design Manual, a roadway shoulder must be at least $1.2 \mathrm{~m}(3.9 \mathrm{ft})$ in width to be usable for bicycle traffic. There are only a few road segments that include a paved shoulder wide enough for safe bicycle traffic. However, in most cases these routes do not provide the required width for an extended length between two destination points. Figure C2.16-1 shows the quality rating of the on-street bicycle network according to the GBNRTC. Designated bicycle lanes and multi-use trails are also identified on this map.

There are no known plans for improvements to bicycle or pedestrian accommodations.

### 2.17 Planned Development for Area

Future highway projects planned by NYSTA, NYSDOT, and local governments in the project area have been identified. These projects have been evaluated to determine the influence, if any, they will have on travel patterns in the project area. These projects are organized below according to their listing in either the Greater Buffalo-Niagara Regional Transportation Council (GBNTRC) Transportation Improvement Program 2002-2006 (TIP) or the GBNRTC 2025 Long-Range Plan For Erie And Niagara Counties.

## GBNRTC Transportation Improvement Program 2002-2006 (TIP)

Construction is complete for the widening of I-90 from six to eight lanes between NY-400 (exit 54 ) and I-190 (exit 53). This will relieve congestion on I-90. The reconstruction of the I-90/I-290 interchange will be let in June 2006. Due to the distant proximity of this project to the Southtowns Connector, these improvements are not expected to produce significant changes in the volume of traffic in the study area.

The Buffalo Fort Erie Public Bridge Authority (BFEPBA) is addressing the need for improvements and possible expansion of the Peace Bridge. This Peace Bridge Configuration Relief project is presently progressing through the Environmental Impact Statement (EIS) phase of planning and could take two years to complete. Design and construction would follow should and alternative be approved. Construction of the Peace Bridge project may not commence until 2006 or 2007. Start of construction could be impacted if right-of-way acquisition is necessary. This project is not expected to produce significant changes in the volume of traffic within the project area if the bridge remains in relatively the same location. Options for new locations, however, are typically considered as part of the EIS process.

The I-190/I-290 Bridge rehabilitation is scheduled to be let in June 2005. The I-290 between I190 and Main Street is scheduled for resurfacing and is anticipated to be in February 2004. The interchange rehabilitation is not expected to cause changes in the volume of traffic in the study area.

## GBNRTC 2025 Long-Range Plan For Erie And Niagara Counties

A number of economic development projects are planned to support economic development in the Buffalo-Niagara region. Highway improvements to expand the commercial, economic and tourism base of the area will aid these redevelopment areas. These economic development projects include the Southtowns Connector Access / Redevelopment Project.

The Project Management Team for the City of Buffalo has developed the South Buffalo Redevelopment Plan to reestablish commercial properties on the former industrial properties located adjacent to Lake Erie. Some of the planned improvements involve the redevelopment of the former Republic Steel (LTV) Properties, the Union Ship Canal, the Lehigh Valley Rail Corridor, and the Lackawanna Commerce Park. The redevelopment plan investigates the possibility of transforming the currently vacant land into light industrial, warehousing, distribution, research and development, corporate facilities, and other office uses. The redevelopment of these sites and the increase in new jobs is still in the planning stages but is reflected in future demographic and travel forecasts for the Southtowns Connector/Buffalo Outer Harbor Project.

This page intentionally blank.

## CHAPTER 3: SCENARIOS

Scenarios/Alternatives considered for the Southtowns Connector / Buffalo Outer Harbor Project are highway infrastructure facilities. They consist of either reconfiguring existing roadways or constructing new facilities.

The major objectives of the project focus on: improving access to specific brownfield development sites in South Buffalo and on the Lake Erie waterfront; reconfiguring the Route 5/Fuhrmann Boulevard/Ohio Street complex into a waterfront arterial system that would be more consistent with local plans; maintaining adequate service for commuter/commercial traffic between the Southtowns and Downtown Buffalo; and improving access in the project area for other modes of transportation (bus, bicycle, pedestrian).

### 3.1 Scenarios Considered

The Scenarios/Alternatives analyzed as a part of this project resulted from community input gathered through the DR/DEIS Scoping Process and Public Scoping Meetings. Scenarios consisted of a "NoBuild" or Null Scenario and seven "Build" Scenarios.

Scenario 2 was developed as a new arterial beginning at an interchange at I-190 near Bailey Avenue and then extending southerly to Tifft Street. This alternative was rejected from consideration due to issues of high costs associated with the interchange configuration, adverse property impacts, lack of accessibility to adjacent properties, and promulgation of circuitous travel patterns.

Six build alternatives, in addition to the Null Scenario, were considered for further evaluation. The Null Scenario consists of the existing highway system, plus improvements outlined in the current Transportation Improvement Program (TIP). Additional information about the TIP is found in Section 3.2 of this chapter. The Null Scenario does not meet any study objectives and is therefore not considered a feasible alternative. However, the Null Alternative is retained to serve as a baseline for comparison of impacts associated with the feasible alternatives. The feasible build alternatives examined in this report are:

## Scenario 1: New Arterial Only

This alternative consists of the existing highway system including improvements outlined in the current TIP, as well as a construction of a new four lane undivided arterial connecting I-190 near Bailey Avenue and extending to Tifft Street.

## Scenario 3: Boulevard Alternative

This alternative includes an at-grade reconfiguration of Route 5 between Ridge Road and the Skyway, and a reconfiguration of Ohio Street between Fuhrmann Boulevard and Michigan Avenue. The remaining highway system within the project area would remain, with improvements as noted in the TIP.

## Scenario 4: Hybrid Alternative

This alternative is similar to Scenario 3 in that it includes an at-grade reconfiguration of both Route 5 between Ridge Road and the Skyway, and Ohio Street between Fuhrmann Boulevard and Michigan Avenue. However, access to Route 5 is limited. Therefore, this alternative contains a parallel service road to provide access to waterfront development. The remaining highway system within the project area would remain, with improvements as noted in the TIP.

## Scenario 5: Modified Improvement Alternative (Preferred Alternative)

This alternative is similar to existing Route 5 between Tifft Street and the Skyway because it is an elevated roadway section with limited access. Therefore, waterfront development access is provided by a parallel service road. An at-grade intersection is provided at Ridge Road. Ohio Street, between Fuhrmann Boulevard and Michigan Avenue, is also reconfigured. The remaining highway system within the project area would remain, with improvements as noted in the TIP.

## Scenario 6: Boulevard Alternative with New Arterial

This alternative is a combination of Scenarios 1 and 3. It is similar to Scenario 3 because it reconfigures Route 5 between Ridge Road and the Skyway, as well as Ohio Street between Fuhrmann Boulevard and Michigan Avenue. In addition, it includes the components of Scenario 1; that is, it includes a new four lane undivided arterial between I-190 (at Bailey Avenue) and Tifft Street. The remaining highway system within the project area would remain, with improvements as noted in the TIP.

Scenario 7: Hybrid Alternative with New Arterial
This alternative is a combination of Scenarios 1 and 4 because it includes a new four lane undivided arterial between I-190 (at Bailey Avenue) and Tifft Street, a reconfigured Route 5 between Ridge Road and the Skyway, a reconfigured Ohio Street between Fuhrmann Boulevard and Michigan Avenue, and also a parallel service road to provide access to the waterfront properties. The remaining highway system within the project area would remain, with improvements as noted in the TIP.

### 3.2 Methodology of Traffic Analysis of Alternatives

The Greater Buffalo Niagara Regional Transportation Council (GBNRTC) is the Metropolitan Planning Organization (MPO) for the Greater Buffalo-Niagara Region. GBNRTC is the interagency transportation planning group which establishes policies and programs, and which provides a regional decision-making forum for the development of a multi-modal, integrated transportation system that best fits the Niagara Frontier.

GBNRTC is responsible for long-range planning of transportation infrastructure improvements and establishment of the near-term Transportation Improvement Program (TIP). The TIP includes all federally funded transportation projects being considered for implementation in the next five-year period (through September of 2006). The GBNRTC, in cooperation with the New York State Department of Transportation (NYSDOT), is responsible for selecting projects to be included in the TIP. The TIP is updated every other year to reflect those projects of highest priority based on need, local desires, long-range plan conformity and funding availability. For this study, the addition of a fourth lane to I-90 between Route 400 and I-190 is contained in the TIP, and was therefore included in the travel forecasts. Construction of the fourth lane to I-90 was completed in 2002.

GBNRTC has developed a travel-forecast model and has defined demographic forecasts to assist with the development of the TIP and the Long Range Plan. The travel-forecast model produces forecasts of 2025 peak hour and average daily traffic volumes (AADT). This model is an approved tool for planning purposes and estimating future travel forecasts.

The travel-forecast model was used to forecast 2030 daily and peak hour travel forecasts for the Southtowns Connector / Buffalo Outer Harbor project. The model produced 2025 estimates of AM and PM peak hour traffic, as well as AADT traffic volumes by direction of highway segments. Year 2030 travel forecasts were developed by straight-line extrapolation from year 2025 forecasts. Existing (Year 2001) volumes were utilized as a base reference for extrapolation.

Year 2030 travel forecasts were utilized to analyze the traffic operations of each build scenario/alternative. Traffic operations are expressed in terms of Levels of Service (LOS). LOS characterizes traffic operations in terms of delay for intersections and density for roadway segments. Density reflects the degree of congestion and freedom of mobility for drivers. Forecasted operating speeds reflect some degree of mobility. Year 2030 operating speeds were estimated by the travel forecast model. They are summarized in Attachment $\mathbf{F}$ for selected highway segments.

LOS ranges from A to F. LOS A describes freely flowing traffic with little or not delay. LOS F describes highly congested conditions with forced (breakdown) flow and substantial delays. Attachment B contains complete definition of expressway LOS.

### 3.3 Scenarios

### 3.3.1 Null Scenario

The Null Scenario consists of the existing highway system plus improvements contained in the Transportation Improvement Program (TIP). The single component of the TIP affecting roadway capacity in the project area is the widening of I-90 between NYS Route 400 (Exit 54) and I-190 (Exit 53). Widening consisted of adding a fourth travel lane to each direction of travel, thus increasing number of directional travel lanes from three to four. This widening project was completed in 2002 and the Null Scenario includes a four lane segment of I-90 between Exit 54 and Exit 53.

Daily traffic volumes for the design year (2030) were estimated to evaluate the traffic characteristics of the Null Scenario. Year 2030 average daily travel forecasts for key roadway segments in the project area are summarized in Table C3.3-1. In addition, the estimated annual average daily traffic (AADT) is summarized in Table C3.3-2 and shown graphically in Figure C3.3-1. Table C3.3-3 and Table C3.3-4 show the existing and estimated future directional traffic volumes for the morning (AM) and afternoon (PM) peak hours, respectively. AM and PM peak hour turning movements of selected intersections forecast for the Null Scenario are shown in Figures C3.3-2 (AM) and C3.3-3 (PM).

Level of Service analysis was performed using year 2030 peak hour travel forecasts produced by the travel-forecast model. Operational analyses (LOS analyses) were conducted for the morning and afternoon peak hour periods because they represent the two critical hours of an average day for traffic. Conditions present during other hours of the day were not studied. It is assumed that these conditions would be more favorable as volumes are typically lower during the remaining hours. A summary of intersection LOS is provided in Table C3.3-5 and roadway LOS is shown in Table C3.3-6. Graphic presentation of congested locations under the Null Scenario in Year 2030 is shown in Figure C3.3-4. A summary of congested locations is contained in Table C3.3-7. Congestion is forecasted at signalized intersections on Route 5, Michigan at South Park Avenue and Ohio Street, at the Skyway, and I-90 between Ridge Road (Exit 55) and I-190 (Exit 53).

Appendix C: Traffic \& Accident Report Chapter 3: Scenarios

Table C3.3-1 - Year 2030 Daily Travel Forecast Summary - Volume Impact Summary

| Road |  | Scenario |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Null | 1 | 3 | 4 | 5 | 6 | 7 |
| Route 5 |  | $53,000=1 \% / \mathrm{yr}$ | Same as Null | $\begin{gathered} \hline 11,000 \text { decrease }= \\ 42,000 \end{gathered}$ | $\begin{gathered} \hline 7,000 \text { decrease }= \\ 46,000 \end{gathered}$ | $\begin{gathered} 2,000 \text { decrease }= \\ 51,000 \end{gathered}$ | $\begin{gathered} \text { 11,000 decrease }= \\ 42,000 \end{gathered}$ | $\begin{gathered} \hline 5,000 \text { decrease }= \\ 48,000 \end{gathered}$ |
| South Park Ave |  | $\begin{gathered} \hline 6,000-8,000= \\ 0.3 \% / \mathrm{yr} \\ \hline \end{gathered}$ | Same as Null | Same as Null | Same as Null | Same as Null | Same as Null | Same as Null |
| Ohio Street |  | $10,000=1 \% / \mathrm{yr}$ | Same as Null | $\begin{gathered} 1,000 \text { increase }= \\ 11,000 \end{gathered}$ | $4,000 \text { increase }=$ $14,000$ | $\begin{gathered} 4,000 \text { increase }= \\ 14,000 \end{gathered}$ | 1,000 increase $=$ 11,000 | $\begin{gathered} 4,000 \text { increase }= \\ 14,000 \end{gathered}$ |

### 3.3.2 Scenario 1 (New Arterial Only)

Scenario 1 consists of the existing highway system including improvements outlined in the current TIP, as well as a construction of a new four lane undivided arterial connecting I-190 near Bailey Avenue and extending to Tifft Street. Alignment and interchange configuration is provided in Figure C3.3-5.

The new road has at-grade signalized intersections with Elk Street, South Park Avenue and Tifft Street. Left turn lanes are provided at each of these intersections for all approaches. The travel lanes at the intersections are 12 feet wide and have curbing. Parking is prohibited on the arterial. Year 2030 average daily travel forecasts for key roadway segments in the project area are summarized in Table C3.3-1. The estimated annual average daily traffic (AADT) is summarized in Table C3.3-2 and shown graphically in Figure C3.3-1. In addition, the existing and estimated future directional traffic volumes are found in Tables C3.3-3 and C3.3-4 for the morning (AM) and afternoon (PM) peak hours, respectively. AM and PM peak hour turning movements of selected intersections forecast for Scenario 1 are shown in Figures C3.3-5 (AM) and C3.3-6 (PM).

Level of Service analysis for year 2030 peak hour travel forecasts is summarized in Table C3.35 for intersections and Table C3.3-6 for expressways. Graphic presentation of congested locations is shown in Figure C3.3-7.

A summary of the congested locations formed under Scenario 1 is contained in Table C3.3-7. Congestion is forecasted at signalized intersections on Route 5, Michigan at South Park Avenue and at Ohio Street, at the Skyway, and I-90 between Ridge Road (Exit 55) and I-190 (Exit 53).

### 3.3.3 Scenario 3 (Boulevard Alternative)

Scenario 3 includes a reconfiguration of the elevated section of Route 5 between Ridge Road and the Skyway, as well as a reconfiguration of Ohio Street between Fuhrmann Boulevard and Michigan Avenue. Route 5 and Fuhrmann Boulevard are reconfigured into a single at-grade urban boulevard with a median. It has six travel lanes between Mile Strip Road and the base of the Skyway and four travel lanes for the Skyway portion. Travel lanes are 12 feet wide with curbing. Parking is prohibited on this new boulevard. The posted speed limit is $64 \mathrm{~km} / \mathrm{h}$ ( 40 $\mathrm{mph})$. All intersections are at-grade. Access to Lake Erie waterfront development along Route 5 is provided, as necessary, to serve waterfront venues. New access is provided to the proposed Union Ship Canal development, both north and south of the canal. Ohio Street contains four travel lanes, each 12 feet wide, and parking is prohibited. Posted speed limit on Ohio Street is 56 $\mathrm{km} / \mathrm{h}(35 \mathrm{mph})$. A graphic presentation of Scenario 3 is shown in Figure C3.3-8.

Year 2030 average daily travel forecasts for key roadway segments in the study area are summarized in Table C3.3-1. The estimated annual average daily traffic (AADT) is summarized

in Table C3.3-2 and shown graphically in Figure C3.3-1. In addition, the existing and estimated future directional traffic volumes are found in Tables C3.3-3 and C3.3-4 for the morning (AM) and afternoon (PM) peak hours, respectively. AM and PM peak hour turning movements of selected intersections forecast for Scenario 3 are shown in Figures C3.3-8 (AM) and C3.3-9 (PM).

Level of Service analysis for year 2030 peak hour travel forecasts is summarized in Table C3.35 for intersections and Table C3.3-6 for expressways. Graphic presentation of congested locations is shown in Figure C3.3-10.

A summary of congested locations is contained in Table C3.3-7. Congestion is forecasted at Michigan intersecting South Park Avenue and Ohio Street, I-90 between Ridge Road (Exit 55) and I-190 (Exit 53), and I-190 between Hamburg Street (Exit N5) and Bailey Avenue (Exit N3) and between Ogden (N1) and I-90 (Exit 53).

### 3.3.4 Scenario 4 (Hybrid Alternative)

Similar to Scenario 3, Scenario 4 - the Hybrid Alternative, reconfigures Route 5 and Ohio Street. However, unlike Scenario 3 where Ohio Street consists of 4 travel lanes, under Scenario 4 Ohio Street will consist of three lanes, one travel lane in each direction with a center two-way left turn lane. Route 5 is also reconfigured differently than described under Scenario 3 in that it has six lanes between Ohio Street and Mile Strip Road, and four lanes between Ohio Street and the Skyway. Like Scenario 3, Route 5 will consist of an at-grade facility. It will be an at-grade urban boulevard with a median. Scenario 4 differs from Scenario 3, in that the only intersections along the newly configured Route 5 will be at Ohio Street, Tifft Street and Ridge Road. Because Scenario 4 has limited access to Route 5 (only at Ohio Street, Tifft Street and Ridge Road), this scenario introduces a parallel service road to provide direct access to adjacent development along the waterfront at the Tifft Nature Preserve, at Union Ship Canal, and for development between Ridge Road and Ohio Street. The parallel service roads are curbed with one 11 -foot travel lane and an 8 -foot parking lane in each direction. The service roads are located on each side of Route 5, as needed, to provide direct access to adjacent development. An interchange will be constructed at the south end of the Skyway with a local access road. Unlike Scenario 3, the posted speed limit on Route 5 for Scenario 4 is $72 \mathrm{~km} / \mathrm{h}(45 \mathrm{mph})$. Figure C3.3-11 contains a graphic presentation of Scenario 4.

Year 2030 average daily travel forecasts for key roadway segments in the project area are summarized in Table C3.3-1. The estimated annual average daily traffic (AADT) is summarized in Table C3.3-2 and shown graphically in Figure C3.3-1. In addition, the existing and estimated future directional traffic volumes are found in Tables C3.3-3 and C3.3-4 for the morning (AM) and afternoon (PM) peak hours, respectively. AM and PM peak hour turning movements of selected intersections for Scenario 4 are shown in Figures C3.3-11 (AM) and C3.3-12 (PM).

Level of Service analysis for year 2030 peak hour travel forecasts is summarized in Table C3.35 for intersections and Table C3.3-6 for expressways. Graphic presentation of congested locations is shown in Figure C3.3-13.

A summary of congested locations is contained in Table C3.3-7. Congestion is forecasted at the intersections of Michigan Avenue with South Park Avenue and Ohio Street, I-90 between Ridge Road (Exit 55) and I-190 (Exit 53), and I-190 between Hamburg Street (Exit N5) and Bailey Avenue (Exit N3) and between Ogden (N1) and I-90 (Exit 53).

### 3.3.5 Scenario 5 (Modified Improvement Alternative- Preferred Alternative)

Scenario 5 also reconfigures both Route 5 and Ohio Street. However, under Scenario 5, Route 5 will appear similar to its current configuration because it consists of a four-lane grade separated expressway between Tifft Street and Ohio Street. Grade separation and interchanges are provided at the intersecting roadways of Ohio Street, Tifft Street and at the south end of the Skyway. The posted speed limit is $80 \mathrm{~km} / \mathrm{h}(50 \mathrm{mph})$. An at-grade intersection is provided at Ridge Road with Route 5. Ohio Street is reconfigured the same as in Scenario 4; that is, with three lanes. Scenario 5 also includes the parallel service roads as detailed in Scenario 4. Figure C3.3-14 contains a graphic presentation of Scenario 5.

Year 2030 average daily travel forecasts for key roadway segments in the project area are summarized in Table C3.3-1. The estimated annual average daily traffic (AADT) is summarized in Table C3.3-2 and shown graphically in Figure C3.3-1. In addition, the existing and estimated future directional traffic volumes are found in Tables C3.3-3 and C3.3-4 for the morning (AM) and afternoon (PM) peak hours, respectively. AM and PM peak hour turning movements of selected intersections for Scenario 5 are shown in Figures C3.3-14 (AM) and C3.3-15 (PM).

Level of Service analysis for year 2030 peak hour travel forecasts is summarized in Table C3.35 for intersections and Table C3.3-6 for expressways. Graphic presentation of congested locations is shown in Figure C3.3-16.

A summary of congested locations is contained in Table C3.3-7. Congestion is forecasted at signalized intersections on Route 5, Michigan Avenue at South Park Avenue and at Ohio Street, Route 5 between Ridge Road and Ohio Street, and I-90 between Ridge Road (Exit 55) and I-190 (Exit 53).

### 3.3.6 Scenario 6 (Boulevard Alternative with New Arterial)

Scenario 6 is a combination of Scenarios 1 and 3. It contains a new four lane undivided arterial connecting I-190 near Bailey Avenue and Tifft Street with identical alignment and configuration as detailed under Scenario 1. See Figure C3.3-5 for additional information. In addition, Scenario 6 contains a reconfiguration of the elevated section of Route 5 between Ridge Road and the Skyway, and a reconfiguration of Ohio Street between Fuhrmann Boulevard and Michigan Street as detailed in Scenario 3. Figure C3.3-8 highlights these reconfigured routes. Route 5 and Fuhrmann Boulevard are reconfigured into a single at-grade urban boulevard with a median. It has six travel lanes between Mile Strip Road and the base of the Skyway and four travel lanes for the Skyway portion. The travel lanes are 12 feet wide and include curbing. Parking is prohibited on the newly configured Route 5. All intersections are at-grade. The posted speed limit is 64 $\mathrm{km} / \mathrm{h}(40 \mathrm{mph})$. Access to Lake Erie waterfront development along Route 5 is provided, as necessary, to serve waterfront venues. New access is also provided to the proposed Union Ship Canal development, both north and south of the canal. Ohio Street is also identical to that described under Scenario 3 and contains four travel lanes, each 12 feet wide. The posted speed limit on Ohio Street is $56 \mathrm{~km} / \mathrm{h}(35 \mathrm{mph})$.

Year 2030 average daily travel forecasts for key roadway segments in the project area are summarized in Table C3.3-1. The estimated annual average daily traffic (AADT) is summarized in Table C3.3-2 and shown graphically in Figure C3.3-1. In addition, the existing and estimated future directional traffic volumes are found in Tables C3.3-3 and C3.3-4 for the morning (AM) and afternoon (PM) peak hours, respectively. AM and PM peak hour turning movements of selected intersections forecast for Scenario 6 are shown in Figures C3.3-17 (AM) and C3.3-18 (PM).

Level of Service analysis for year 2030 peak hour travel forecasts is summarized in Table C3.35 for intersections and Table C3.3-6 for expressways. Graphic presentation of congested locations is shown in Figure C3.3-19.

A summary of congested locations is contained in Table C3.3-7. Congestion is forecasted at intersections of Michigan at South Park Avenue and at Ohio Street, I-90 between Ridge Road (Exit 55) and I-190 (Exit 53), and I-190 between I-90 (Exit 53) and Hamburg Street (Exit N5).

### 3.3.7 Scenario 7 (Hybrid Alternative with New Arterial)

Scenario 7 is a combination of Scenarios 1 and 4. Therefore, it contains a new four lane undivided arterial connecting I-190 near Bailey Avenue and Tifft Street with identical alignment and configuration as detailed under Scenario 1, (see Figure C3.3-5). In addition, Scenario 7 includes the reconfigurations of Route 5 and Ohio Street as detailed under Scenario 4, (see Figure C3.3-11). Route 5 would be reconfigured as an at-grade urban boulevard with a median and would contain six lanes between Ohio Street and Mile Strip Road and four lanes between Ohio and the Skyway. The posted speed limit on Route 5 south of Ohio Street is $72 \mathrm{~km} / \mathrm{h}$ ( 45
$\mathrm{mph})$; north of Ohio Street it is $88 \mathrm{~km} / \mathrm{h}(55 \mathrm{mph})$. Ohio Street would be reconfigured into a three lane route, with one travel lane in each direction and a center two-way left turn lane. Finally, Scenario 7 would also include a parallel service road system on each side of Route 5, as needed, to provide direct access to adjacent development along the waterfront, at Tifft Nature Preserve, and at the Union Ship Canal development between Ridge Road and Ohio Street. The parallel service roads are curbed and have one 11 -foot travel lane and an 8 -foot parking lane in each direction.

Year 2030 average daily travel forecasts for key roadway segments in the project area are summarized in Table C3.3-1. The estimated annual average daily traffic (AADT) is summarized in Table C3.3-2 and shown graphically in Figure C3.3-1. In addition, the existing and estimated future directional traffic volumes are found in Tables C3.3-3 and C3.3-4 for the morning (AM) and afternoon (PM) peak hours, respectively. AM and PM peak hour turning movements of selected intersections forecast for Scenario 7 are shown in Figures C3.3-20 (AM) and C3.3-21 (PM).

Level of Service analysis for year 2030 peak hour travel forecasts is summarized in Table C3.3-5 for intersections and Table C3.3-6 for expressways. Graphic presentation of congested locations is shown in Figure C3.3-22.

A summary of congested locations is contained in Table C3.3-7. Congestion is forecasted at intersections of Michigan Avenue with South Park Avenue and Ohio Street, as well as I-90 between Ridge Road (Exit 55) and I-190 (Exit 53), I-190 between I-90 (Exit 53) and Ogden Street (Exit N1), and I-190 between Smith Street (Exit N4) and Hamburg Street (Exit N5).

### 3.4 Summary of Scenarios

The focus of the Southtowns Connector / Buffalo Outer Harbor Environmental Impact Study has been to examine two corridors for highway improvements. The impact of traffic volume forecasts and traffic operations generated by the different build scenarios has been identified.

The impact of build scenarios on travel forecasts and traffic operations is based on comparisons to the "do nothing" option, or NULL Scenario. Scenario 1 is the inclusion of a new four-lane arterial road from Tifft Street extending northerly to Interstate 190 (I-190) near Bailey Avenue. The arterial has limited access and an interchange with I-190. Three other scenarios (Scenarios 3, 4 and 5) pertain to the Route 5 corridor between the Skyway Bridge and Mile Strip Road. Scenarios 3 and 4 convert the roadway to a six-lane at-grade boulevard; however, Scenario 4 has limited access to Route 5. Scenario 5 retains most of Route 5 as an elevated expressway and converts Fuhrmann Boulevard to a two-way roadway located on the west side of Route 5. Scenario 6 is a combination of Scenarios 1 and 3 and Scenario 7 is a combination of Scenarios 1 and 4.

The impact of future daily travel forecasts on the principle roadways in the project area compared to those for the NULL Scenario are summarized in Table C3.3-1 and Table C3.3-2. The results indicate that:

- The new 4-lane arterial (Scenario 1) compared to scenarios for Route 5 has its own traffic utility and is independent of improvements to Route 5. The converse is also true: improvements to Route 5 do not affect travel forecasts for the new 4-lane arterial.

Conversion of Route 5 from an expressway to a boulevard results in slower travel speeds along the corridor. The reduction in overall travel speed causes a diversion of traffic from the Route 5 corridor to Interstates 90 and 190. The magnitude of diversion from Route 5 varies between approximately 10,000 and 5,000 vehicles a day between Scenario 3 and 4, respectively, due to slower speeds for Route 5 in Scenario $3(40 \mathrm{mph})$ compared to those for Scenario $4(45 \mathrm{mph})$.

Impact of travel forecasts on traffic operations are summarized in Tables C3.3-5 and C3.3-6. The results reflect that as travel forecasts are similar between scenarios, so are the traffic operation forecasts. Therefore, intersections with forecasted congestion (LOS E or F) are similar for the NULL and Scenario 1. Congestion at four intersections on Route 5 and two on Michigan Avenue are common to these two scenarios. In addition, both scenarios have similar expressway roadway segments forecasted to have congestion.

Scenarios 3, 4, 6 and 7 retain a similar configuration of Route 5; that is, a 6 lane boulevard between Ohio Street and Mile Strip Road. The slower speeds associated with the boulevard configuration causes sufficient diversion of traffic to the expressway system (Interstates 90 and 190) to provide acceptable traffic operations along Route 5 through the signalized intersections. The added traffic forecasted to the interstate system causes congestion along all segments of I190 between I- 90 and the Skyway Bridge and on I-90 between Ridge Road and I-190.

Scenario 5 has modified improvements to Route 5 consisting of an at-grade intersection with Ridge Road, 6 lane arterial between Ridge and Lake, and an expressway from Tifft to I-190 as presently configured. With the additional segment of Route 5 being an arterial at Ridge Road some diversion of traffic occurs to the Interstate system of I-90 and I-190. The diversion provides acceptable traffic operations along Route 5 through the signalized intersections with the exception at Ridge Road. In addition, the added traffic forecasted to the interstate system yields expressway roadway segments forecasted to have congestion slightly greater than those for the NULL and Scenario 1, but less than those for scenarios 3 and 4.
